**GRADO EN INGENIERÍA NAVAL Y OCEÁNICA**  
**TRABAJO FIN DE GRADO**

**PROYECTO NÚMERO: 18-12**

**TIPO DE BUQUE:** Bulkcarrier tipo “NEOPANAMAX” de 120.000 TPM adaptado a la operación en terminales graneleras del golfo de México y Asia.

**CLASIFICACIÓN, COTA Y REGLAMENTOS DE APLICACIÓN:** AMERICAN BUREAU OF SHIPPING, SOLAS, MARPOL y EXIGENCIAS DE LA ACP (Autoridad del Canal de Panamá).

**CARACTERÍSTICAS DE LA CARGA:** 120.000 T.P.M. grano, mineral, carbón

**VELOCIDAD Y AUTONOMÍA:** 14 nudos en condiciones de servicio, 85% de MCR + 15% de margen de mar. 12.000 millas a la velocidad de servicio.

**SISTEMAS Y EQUIPOS DE CARGA / DESCARGA:** Escotillas de accionamiento hidráulico.

**PROPULSIÓN:** Un motor diesel acoplado a una hélice de paso fijo, motores auxiliares de tipo dual (FUEL-GNL).

**TRIPULACIÓN Y PASAJE:** 30 tripulantes en camarotes individuales.

**OTROS EQUIPOS E INSTALACIONES:** Los habituales en este tipo de buques y posibilidad de interconexión del cuadro eléctrico del buque con la corriente de tierra.

## 2 INTRODUCCIÓN

En este Cuaderno llevaremos a cabo el compartimentado de nuestro buque, así como el cálculo de las tablas hidrostáticas y las curvas de brazos de adrizamiento del mismo.

Las dimensiones y coeficientes de nuestro Buque Proyecto, obtenidas en el Cuaderno 3 "Coeficientes y Plano de Formas", son las siguientes:

### DIMENSIONES, COEFICIENTES y CARACTERÍSTICAS

Eslora total (LOA)	250	m
Eslora entre perpendiculares (Lpp)	245,5	m
Manga (B)	42,4	m
Calado (T)	14,9	m
Puntal (D)	21,55	m
Desplazamiento ( $\Delta$ )	142652	Tn
Superficie Mojada ( $m^2$ )	16380	$m^2$
Coeficiente Bloque (Cb)	0,897	
Coeficiente Prismático (Cp)	0,901	
Coeficiente de la Maestra (Cm)	0,996	
Coeficiente de Flotación (Cf)	0,957	
Velocidad (knots)	14	knots
Potencia (kW)	21660	kW

### 3 CÁLCULO DE HIDROSTÁTICAS

En este apartado calcularemos las tablas hidrostáticas del buque a través del software Maxsurf mediante dos métodos:

En primer lugar mediante la **variación de desplazamiento**:

Como desplazamiento mínimo hemos seleccionado 21000 Tn (por debajo del rosca) y como desplazamiento máximo 150.000 Tn (por encima del desplazamiento real del buque) obteniendo 16 desplazamientos distintos con sus calados, con una variación de 8900 Tn entre cada uno de ellos.

En segundo lugar mediante la **variación de calado**:

Como calado mínimo hemos tomado 2,5m (coincidiendo algo por debajo del rosca) y mediante variaciones de 0,86m hasta 15,4m, obteniendo así 16 condiciones de calado distintas con sus correspondientes desplazamientos.

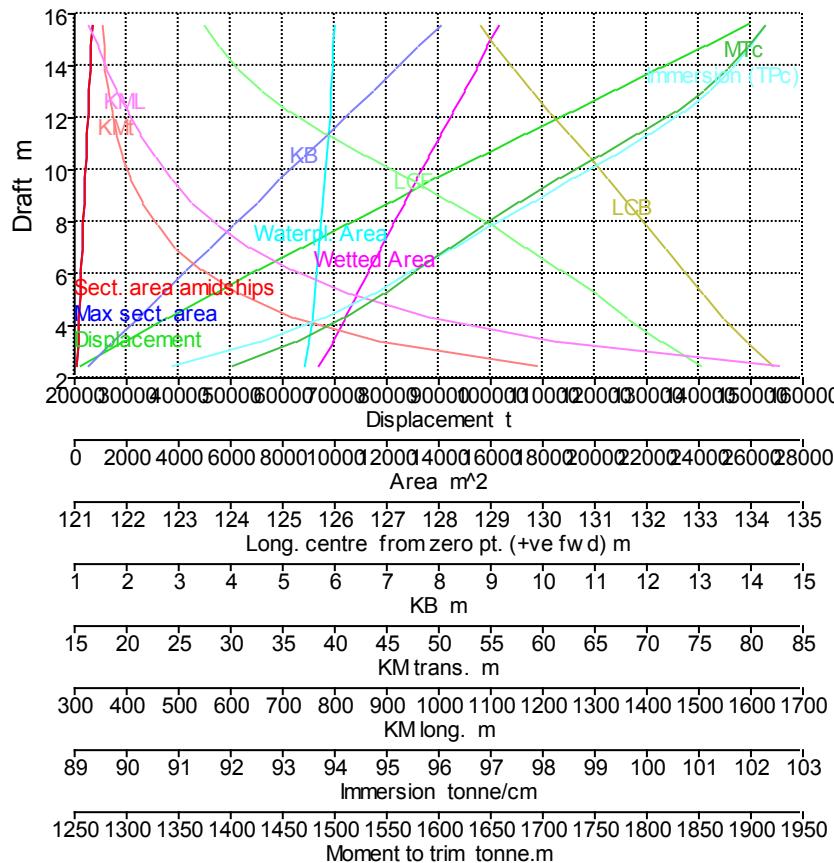

Calcularemos las hidrostáticas para 3 casos de trimado:

- Trimado 0
- Trimado positivo correspondiente a un +0,8% de la eslora entre perpendiculares, o lo que es lo mismo, un trimado de 2m.
- Trimado negativo correspondiente a un -0,8% de la eslora entre perpendiculares, o lo que es lo mismo, un trimado de -2m.

A continuación adjunto las tablas hidrostáticas y sus curvas correspondientes

## 4 CÁLCULO DE CURVAS DE BRAZOS DE ADRIZAMIENTO (KN)

En este apartado calcularemos las curvas de KN del buque poryecto mediante el software Maxsurf siguiendo el mismo método de variación del desplazamiento y variación del calado que hemos empleado para el cálculo de las hidrostáticas.

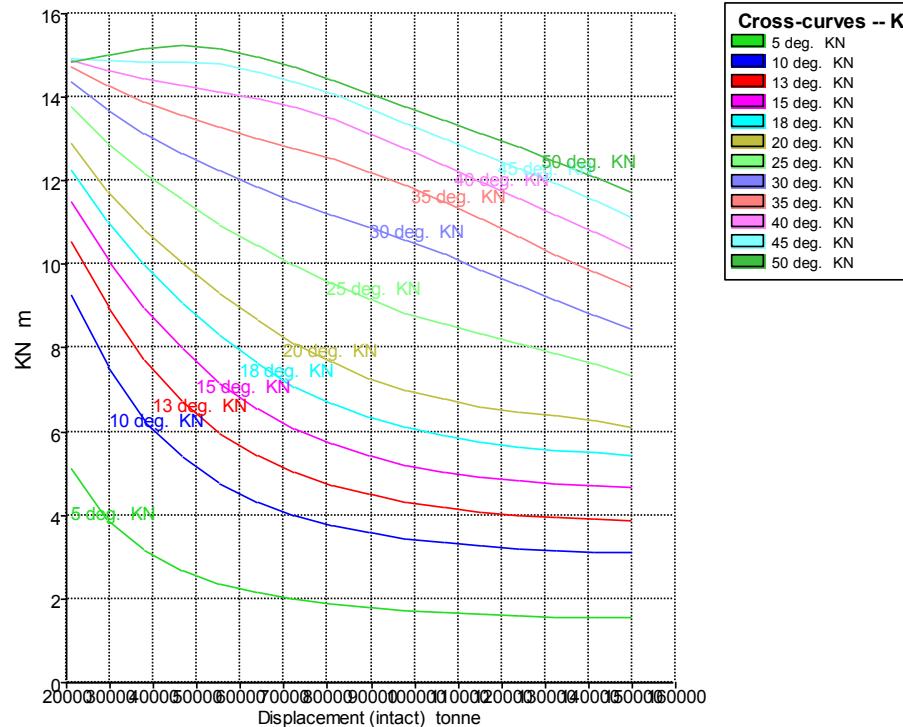

En este caso también obtendremos las curvas de KN para 3 trimados diferentes:

- Trimado 0
- Trimado positivo correspondiente a un +0,8% de la eslora entre perpendiculares, o lo que es lo mismo, un trimado de 2m.
- Trimado negativo correspondiente a un -0,8% de la eslora entre perpendiculares, o lo que es lo mismo, un trimado de -2m.

A continuación adjunto las tablas de KN para los distintos angúlos así como sus curvas características:

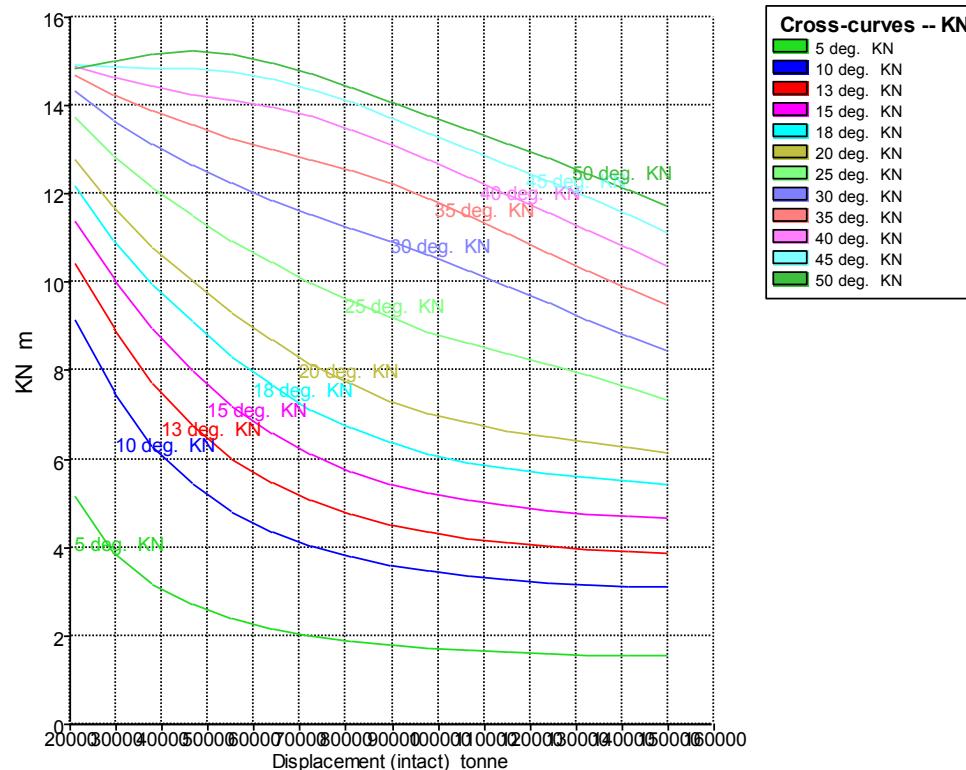

## 4.1 Trimado 0 (Por Desplazamientos)

## 5 ZONA ESTANCA Y PUNTOS DE INUNDACIÓN PROGRESIVA

En nuestro Buque Proyecto la zona estanca estaría por debajo de la cubierta principal, puesto que las tapas de escotillas son estancas, y también entre la cubierta principal y las dos primeras cubiertas de la zona de habilitación, puesto que esos 2 primeros niveles cuentan con puertas y cierres estancos. Por encima de esos niveles ya no serían estancos y se encontrarían los puntos de inundación progresiva que aparecen fijados en el **Anexo 1\_Plano Zona Estanca**, como muestra una captura.

Estos puntos de inundación progresiva corresponden con las ventilaciones de la cámara de máquinas y la puerta de acceso a la zona de habilitación correspondiente a esa cubierta, la tercera. Sus coordenadas son las siguientes:

PUNTOS INUNDACIÓN PROGRESIVA			
Nombre	X (m)	Y (m)	Z (m)
Ventilacion 1 ER	11,9	8	28
Ventilacion 1 BR	11,9	-8	28
Ventilacion 2 ER	13,28	8	28
Ventilacion 2 BR	13,28	-8	28
Ventilacion 3 ER	15,83	8	28
Ventilacion 3 BR	15,83	-8	28
Ventilacion 4 ER	17,36	8	28
Ventilacion 4 BR	17,36	-8	28
Acceso Habilitacion ER	26,03	11,9	28
Acceso Habilitacion BR	26,03	-11,9	28

## 6 COMPARTIMENTADO

Dividiremos el buque distinguiendo tres tipos de compartimentado:

- Compartimentado longitudinal: incluiremos pique de proa, pique de popa y espacios de carga.
- Compartimentado transversal: relativo al doble casco
- Compartimentado vertical: incluye el doble fondo y la cubierta.

Para llevar a cabo el compartimentado del buque seguiremos las reglas de la IACS para bulkcarriers aplicables a aquellos bulkcarriers con las siguientes características:

$$L < 350m$$

$$L/B > 5$$

$$B/D < 2,5$$

$$C_B \geq 0,6$$

Los cuales cumple nuestro buque.

### 6.1 Compartimentado longitudinal

#### 6.1.1 Espaciado de Cuadernas

Para definir nuestra separación entre cuadernas debemos comprobar la separación máxima definida por el American Bureau of Shipping, esta viene indicada en la *Parte 3, Capítulo 2, Sección 5, Apartado 1.7 del ABS RULES FOR BUILDING AND CLASSING STEEL VESSELS 2007*:

$$S = 2,08 * L + 438$$

dónde

$L$  = eslora de escantillonado definida en el **apartado 3/1.1.1** del mismo Reglamento como:

$$L_{SC} = Max(0,96 * L_{WL}; MIN[0,97 * L_{WL}; L_{pp}] )$$

$$L_{WL} = 250$$

sustituyendo:  $L_{SC} = Max(240; MIN[242,5; 245,5] ) = 242,5 m$

y S:  $S = 2,08 * 242,5 + 438 = 942 mm$

De forma que nuestra separación entre Cuadernas deberá ser inferior a 942mm.

Siguiendo las separaciones de los buques similares tomados como referencia, el espaciado de cuadernas en el Buque Proyecto será el siguiente:

- Pique de popa: 600 mm
- Cámara de máquinas: 800 mm
- Espacios de carga: 800 mm
- Pique de proa: 600 mm

### 6.1.2 Longitud de Averías

La longitud de avería  $L_{AV}$  viene definida en “Enmiendas al Protocolo de 1988 relativo al Convenio sobre Líneas de Carga de 1966” Regla 27 apartado 12f:

*“Cuando se prevea inundación de dos compartimientos adyacentes cualesquiera dispuestos en sentido longitudinal, la separación mínima entre mamparos estancos transversales principales será de 1/3  $L^{2/3}$  o de 14,5 m, si este valor es menor, para que puedan ser considerados eficaces. Si la distancia que media entre los mamparos transversales es menor, se supondrá que no existen uno o más de éstos a fin de alcanzar la separación mínima entre mamparos.”*

$$L_{AV} = \text{Max}\left(\frac{L^{2/3}}{3}; 14,5m\right)$$

Donde:  $L = \text{Max}(0,96 * L_{85\%D}; L_{PP85\%D})$

$L_{85\%D}$  = Eslora total de una flotación situada al 85% del puntal, medida desde el canto alto de la quilla.

$$85\%D = 18,32 \text{ m}$$

$$L_{85\%D} = 250 \text{ m}$$

$$L_{pp85\%D} = 245,5 \text{ m}$$

Por lo que la eslora será:

$$L = \text{Max}(0,96 * 250; 245,5) = \text{Max}(240; 245,5) = 245,5 \text{ m}$$

Y la longitud de averías en función de esa eslora será:

$$L_{AV} = \text{Max}\left(\frac{245,5^{2/3}}{3}; 14,5m\right) = \text{Max}(13,07m; 14,5m) = 14,5m$$

Conociendo el valor de la longitud de averías de 14,5 m podemos establecer el espaciado entre mamparos transversales, siempre con distancias superiores a esta para que en caso de avería estudiada sólo dañásemos un compartimento.

### 6.1.3 Pique de Popa

El mamparo que limita con la cámara de máquinas se encontrará a 10,8 m de la perpendicular de popa, y la longitud total del pique será de 16,2m. El espaciado entre cuadernas en esta zona será de 600 mm por lo que el Pique de Popa abarcará de la Cuaderna 0 a la 18. Cumplirá principalmente la función de tanque de agua de lastre, aunque también albergará otros tanques estructurales destinados al almacenamiento de fuel o agua dulce.

### 6.1.4 Cámara de Máquinas

La longitud total de la misma es de 28 m, y la separación de cuadernas en este espacio será de 800 mm por lo que comprenderá de la Cuaderna 18 a la 53.

Mediante la siguiente aproximación podemos conocer la limitación en longitud para el motor propulsor:

$$L_{CM} = L_M + 6m \text{ por popa} + 4m \text{ por proa}$$

Según esta estimación nos permite emplear un motor de hasta 18m de longitud, lo cual no nos influiría en el primer motor considerado, seleccionado en el Cuaderno 1, ya que este tiene una longitud de 9,4m. Esto nos permite instalar motores auxiliares para la generación eléctrica en la cámara de máquinas.

### 6.1.5 Bodegas de Carga

El buque de Proyecto contará con 7 bodegas de carga. Empezando a numerarlas por proa, las longitudes de las bodegas de carga son las siguientes:

<b>LONGITUD BODEGAS DE CARGA</b>		
Bodega Nº1	22,4	m
Bodega Nº2	28	m
Bodega Nº3	28	m
Bodega Nº4	28	m
Bodega Nº5	28	m
Bodega Nº6	28	m
Bodega Nº7	28	m

La bodega Nº1 será más pequeña que las demás para poder disponer de una tapa de escotilla menor que las demás y así poder extender el castillo de proa más a popa para prevenir problemas con el francobordo y ganar cierto margen.

La separación entre Cuadernas en los espacios de carga será de 800 mm por lo que abarcarán de la Cuaderna 53 a la Cuaderna 291.

El número de mamparos transversales mínimo exigidos según el reglamento de la sociedad de clasificación es de 5. Nuestro buque presenta los siguientes mamparos transversales con referencia a la perpendicular de popa:

<b>MAMPAROS TRANSVERSALES</b>		
Pique de popa	10,8	m
Mamparo proa cámara de máquinas	38,8	m
Mamparo proa bodega 7	66,8	m
Mamparo proa bodega 6	94,8	m
Mamparo proa bodega 5	122,8	m
Mamparo proa bodega 4	150,8	m
Mamparo proa bodega 3	178,8	m
Mamparo proa bodega 2	206,8	m
Mamparo proa bodega 1 = pique de proa	229,2	m

### 6.1.6 Pique de proa

El pique de proa vendrá determinado por la situación del **mamparo de colisión**, cuyo emplazamiento viene definido por la Sociedad de Clasificación. Tomando como referencia el SOLAS Capítulo II-I, Parte B, Reg.11:

*Se instalará un mamparo de colisión que será estanco hasta la cubierta de francobordo. Este mamparo estará situado a una distancia de la perpendicular de proa no inferior al 5% de la eslora del buque o a 10m si esta segunda magnitud es menor, dicha distancia no será superior al 8% de la eslora del buque.*

*Cuando cualquier parte del buque que quede debajo de la flotación se prolongue por delante de la perpendicular de proa, como por ejemplo ocurre con una proa de bulbo, las distancias estipuladas en el párrafo anterior se medirán desde un punto situado a mitad de dicha prolongación; o a una distancia igual al 1.5% de la eslora del buque, por delante de la perpendicular de proa; o a una distancia de 3m por delante de la perpendicular de proa; tomándose de esas medidas la menor.*

Lo que coincide con lo especificado por el ABS en la Parte 3, Capítulo 3.1 para el mamparo de colisión, que deberá estar situado entre los siguientes valores.

$$\text{Min}\{0,05 * L_{FL}; 10\} < L_{PPR} < 0,08 * L_{FL}$$

donde:

$$L_{FL} = \text{eslora en la flotación de máxima carga} = 250 \text{ m}$$

sustituyendo:

$$\text{Min}\{12,5; 10\} = 10 < L_{PPR} < 20$$

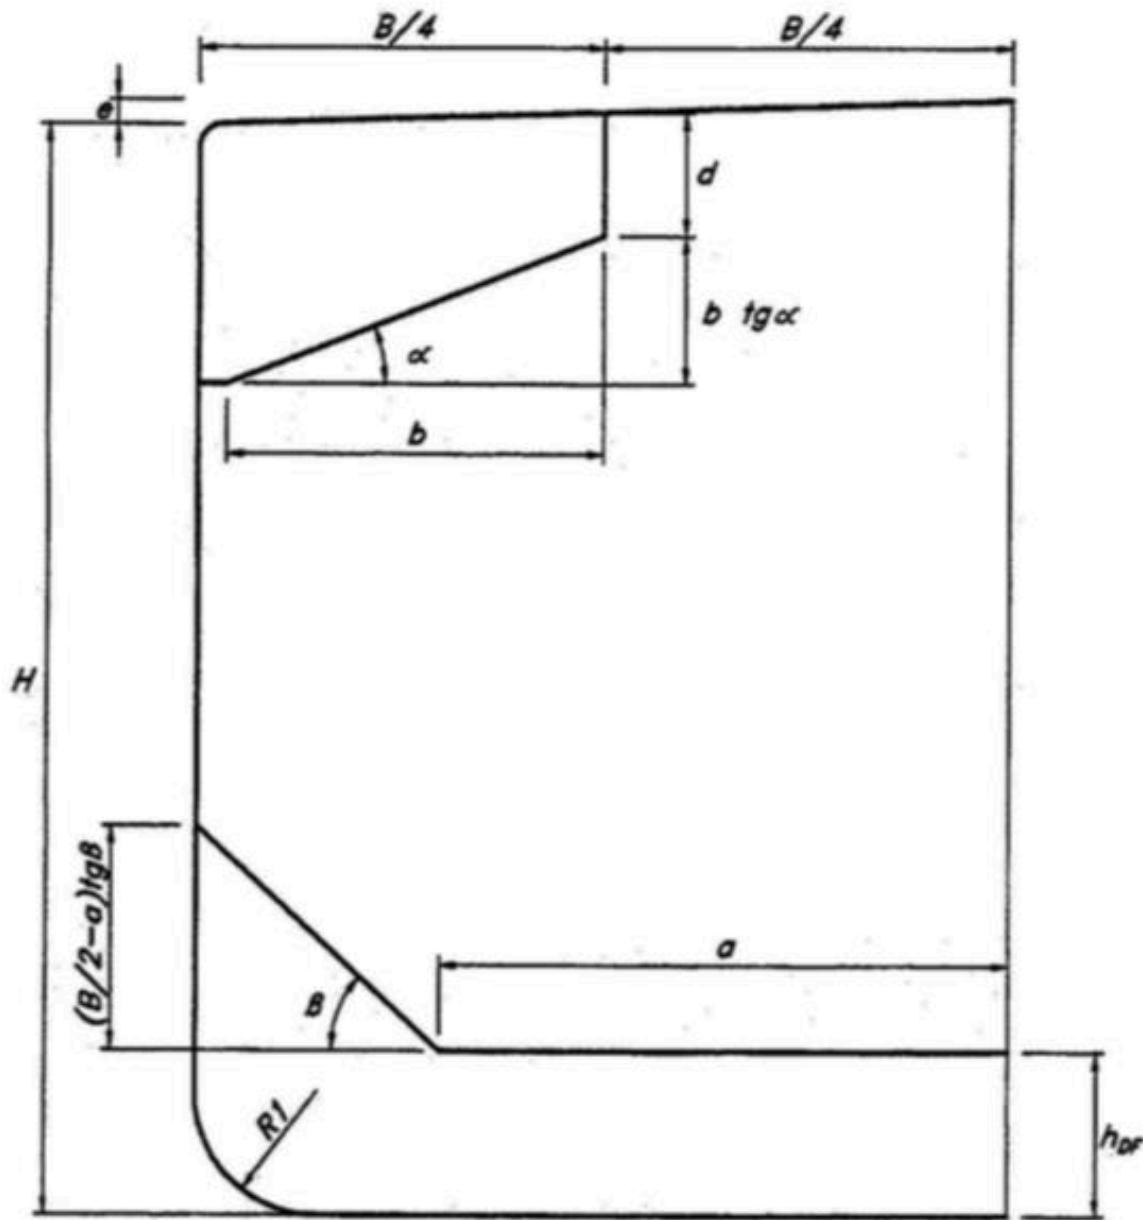

En nuestro caso:  $L_{PPR} = 16,3 \text{ m}$

La separación entre Cuadernas en el pique de proa será de 600 mm a excepción de la última Cuaderna de proa que será de 100 mm, abarcará de la Cuaderna 291 a la 319.

## 6.2 Compartimentado transversal

De manera preliminar, para definir los espacios interiores de las bodegas necesitamos estimar las dimensiones principales de la cuaderna maestra. Para ello debemos definir nuestro doble casco y las dimensiones de las tolvas.

En nuestro caso, para compensar el volumen de bodega perdido debido al doble fondo y al doble casco, decidí reducir los ángulos obtenidos para las tolvas. Para esto usaremos como referencia la cuaderna maestra que cita Manuel Arnaldos Martínez en su artículo "Dimensionamiento de Bulkcarriers", que es la siguiente:

Datos conocidos de la maestra:

$$B = 42,4 \text{ m}$$

$$H = 21,55 \text{ m}$$

Se cumplen las siguientes relaciones, teniendo en cuenta que pierdo 4m de manga por el doble casco:

$$0,7 * B \leq 2 * a \leq 0,9 * B \quad \rightarrow \quad 14,84 \leq a \leq 19,08 \text{ m}$$

$$0,16 * B \leq b \leq 0,22 * B \quad \rightarrow \quad 6,784 \leq b \leq 9,064 \text{ m}$$

$$d + b * \tan \alpha = 0,25 * H \quad \rightarrow \quad d + b * \tan \alpha = 5,3875$$

### Parámetro a:

$$a = \frac{13,44 + 17,28}{2} = 15,36 \approx 15,4 \text{ m}$$

### Parámetro e (brusca):

$$e = 0 \text{ m}$$

### Parámetro b:

$$b = \frac{6,144 + 8,448}{2} = 7,296 \approx 7,3 \text{ m}$$

### Parámetro d:

Le asigno un valor de 1 m y compruebo el valor obtenido para  $\alpha$ .

### Parámetro $\alpha$ :

$$\alpha = \arctan\left(\frac{5,3875 - d}{b}\right) = \arctan\left(\frac{5,3875 - 1}{8}\right) = 29,91^\circ \approx 30^\circ$$

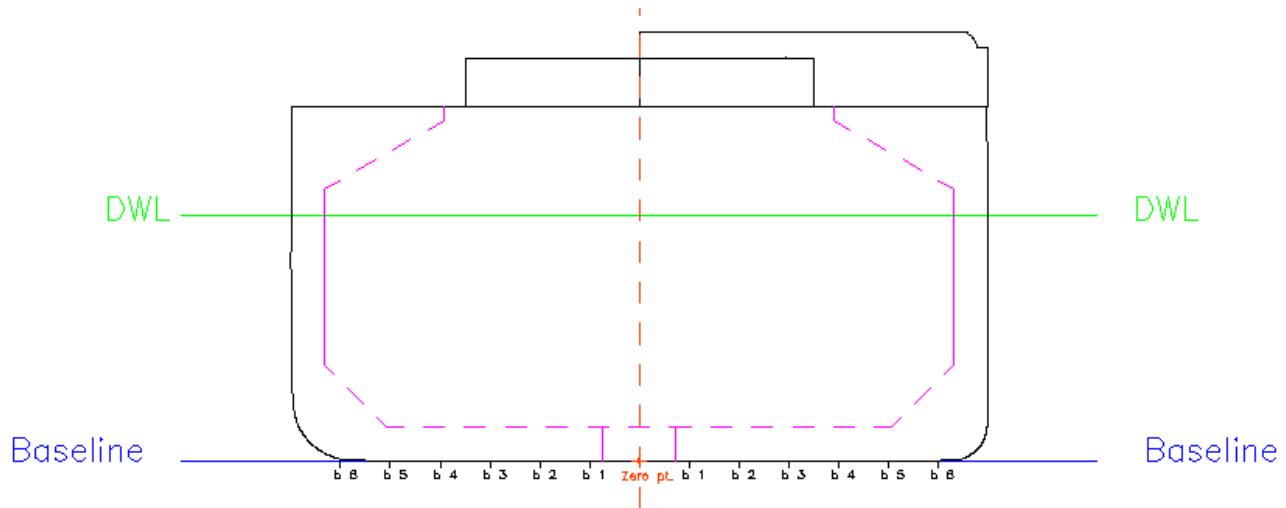

Ahora recalcúlo d:

### Parámetro d:

$$d = 5,3875 - 8 * \tan(30) = 0,77 \approx 0,8 \text{ m}$$

### Parámetro $\beta$ : $\beta = 45^\circ$

Con estos parámetros procedo a dibujar las tolvas sobre la cuaderna maestra que se incluirá en el plano general anexado posteriormente. Como muestra presentamos la siguiente imagen:

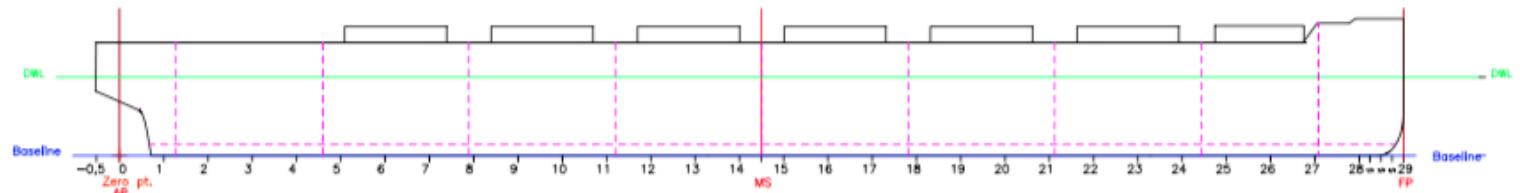

### 6.2.1 Resumen posición Mamparos y Cuadernas

Como resumen recojo en la siguiente tabla la posición de los distintos mamparos transversales así como la longitud de los diferentes espacios que estos delimitan:

MAMPAROS	P. LONG (m)	ESPACIO	Longitud (m)	CUADERNA
		Pique de popa	15,3	0 - 18
Mpro, Popa CC. MM.	10,8	CC. MM.	28	18 - 53
Mpro, Popa Bodega Nº7	38,8	Bodega Nº7	28	53 - 88
Mpro, Popa Bodega Nº6	66,8	Bodega Nº6	28	88 - 123
Mpro, Popa Bodega Nº5	94,8	Bodega Nº5	28	123 - 158
Mpro, Popa Bodega Nº4	122,8	Bodega Nº4	28	158 - 193
Mpro, Popa Bodega Nº3	150,8	Bodega Nº3	28	193 - 228
Mpro, Popa Bodega Nº2	178,8	Bodega Nº2	28	228 - 263
Mpro, Popa Bodega Nº1	206,8	Bodega Nº1	22,4	263 - 291
Mpro, Popa Pique Proa	229,2	Pique Proa	16,3	291 - 319
Lpp	245,5			

La posición longitudinal de cada mamparo se encuentra referencia a la perpendicular de popa situada en el eje de la mecha del timón.

Se puede observar la colocación de cada uno en el PLANO GENERAL que figura como **Anexo 2\_Plano Tanques**. Como muestra, una captura de imagen del mismo:

## 6.3 Compartimentado Vertical

### 6.3.1 Doble Fondo

De acuerdo con lo especificado en el reglamento de la Sociedad de Clasificación (Parte 3, Capítulo 2, Sección 4, Apartado 3.1.1 ABS 2007), la altura mínima exigida se obtiene a partir de la siguiente expresión:

$$H_{minDF} = 32 * B + 190 * T^{\frac{1}{2}} = 2090 \text{ mm}$$

Donde:  $B$  = manga (m)

$T$  = calado (m)

**La altura del doble fondo en nuestro caso es de 2,1 m.**

### 6.3.2 Túnel de Tuberías

El buque dispondrá de un **túnel central de tuberías cuya semimanga es de 2,2 m** y que se extiende por todo el doble fondo. Este túnel divide simétricamente el doble fondo en espacios destinados a agua de lastre.

### 6.3.3 Cubierta

Este tipo de buques poseen una sola cubierta y que estará situada a la altura del puntal, es decir, a 21,55 m desde la línea de base.

### 6.3.4 Castillo

El castillo tendrá una eslora mínima del 7% de Lpp y una altura que no debe ser menor a:

1. la altura que cumpla con los requerimientos del Convenio Internacional de Líneas de Carga de 1966 y su protocolo de 1988 (2,7m).
2.  $H_c + 0,5 \text{ m}$  donde  $H_c$  es la altura de la brazola de escotilla situada más a proa, que en este caso será la brazola de la escotilla N°1, en nuestro caso  $H_c = 3 \text{ m}$ .

La altura mínima será la mayor de estas dos.

La altura de nuestro castillo no será menor de 3,5 m ni más corta que 17,15 m desde la perpendicular de proa.

**En nuestro Buque Proyecto la altura del castillo será de 3,6 m**, como ya hemos considerado para la primera estimación del francobordo en el Cuaderno 1, y **tendrá una longitud de 17,3 m.**

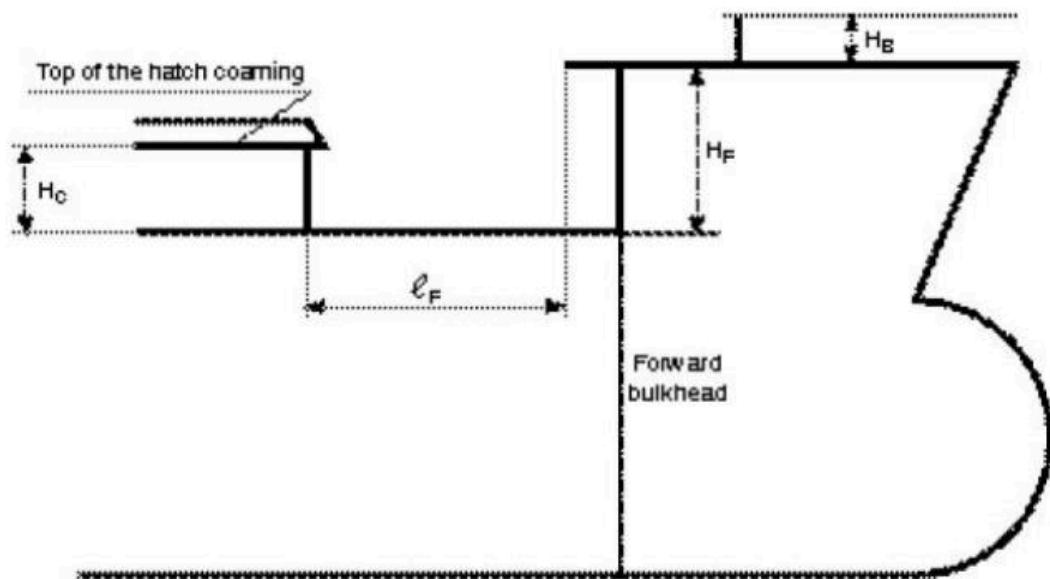

Por otra parte, la localización del extremo del castillo según las sociedades de clasificación ha de estar a una distancia  $l_F$  de la escotilla de la bodega N°1:

$$l_F \leq 5 * \sqrt{H_F - H_c}$$

Las definiciones de  $H_F$  y  $H_c$  se pueden ver en el siguiente gráfico y en nuestro caso tienen los valores de 3,6 m y 3 m respectivamente, sustituyendo:

$$l_F \leq 3,9 \text{ m}$$

En nuestro caso el valor de  $l_F$  será de 2,35 m.

## 7 CAPACIDADES DE TANQUES

A continuación estimaremos la capacidad mínima necesaria en los diferentes tanques para cumplir con el RPA de la autonomía. Como veremos en el siguiente capítulo, en las tablas de capacidades, todas estas capacidades mínimas serán superadas con cierto margen.

### 7.1 Capacidad Heavy Fuel Oil (HFO)

La autonomía de nuestro buque será de 12.000 millas y la velocidad de servicio de 14 nudos. Por lo tanto el tiempo de navegación será:

$$T_{NAV} = \frac{Autonomía}{V_{servicio}} = \frac{12000}{14} = 857,14 \text{ horas} = 35,71 \approx 35 \text{ días}$$

El consumo específico de diésel pesado de nuestro motor principal, extraído del catálogo de WinGD será de 163,2 g/kW\*h al 85% de su capacidad y a las revoluciones necesarias para impulsar el barco a una velocidad de 14 nudos.

Por lo tanto la cantidad total de HFO a transportar será:

$$\text{Consumo HFO} = \frac{Autonomía}{V_{servicio}} * \text{Consumo} \left( \frac{g}{kW} * h \right) * \text{Potencia} * \text{Régimen}$$

$$\text{Consumo HFO} = \frac{12000}{14} * 163,2 * 21660 * \frac{1}{10^6} * 0,85 = 2575,43 \text{ t}$$

Aplicando una densidad de  $\rho = 0,98 \text{ Tn/m}^3$  obtenemos el volumen de fuel necesario, y después le añadimos un 10% de margen ya que las bombas no aspiran bien cuando queda menos del 10% y otros factores:

$$V_{HFO} = \left( \frac{2575,43}{0,98} \right) + 10\% = 2627 * 1,1 = 2890 \text{ m}^3$$

Esta es la capacidad correspondiente a los tanques almacén.

#### 7.1.1 Capacidad de almacenamiento del tanque de uso diario de HFO:

Ahora estimaremos la capacidad de los tanques de uso diario, esta capacidad viene definida por SOLAS como mínimo para cubrir 8 horas de funcionamiento del motor principal, y deberán estar duplicados. Nosotros estimaremos su capacidad para 24 horas de funcionamiento, para ello dividimos la cantidad de combustible total entre los días de funcionamiento del motor para cubrir la autonomía ya fijada:

$$V_{SERV\_HFO} = \frac{V_{HFO}}{T_{NAV}} = \frac{2890}{35} = 82,5 \approx 83 \text{ m}^3$$

#### 7.1.2 Capacidad de almacenamiento del tanque de sedimentación de HFO:

Su volumen viene dado por Solas mediante la fórmula:

$$V_{SED\_HFO} = \frac{5,7 * MCR}{1000} = \frac{5,7 * 21660}{1000} = 123 \text{ m}^3$$

### 7.1.3 Capacidad del tanque de reboses de HFO:

Su volumen mínimo de almacenamiento es una estimación correspondiente al volumen de 10 o 15 minutos en tiempo de carga de los tanques de almacenamiento.

Suponiendo una velocidad de carga aproximada de 100 m<sup>3</sup>/hora el volumen aproximado del tanque de reboses será:

$$V_{REBOSES\_HFO} = V_{llenado} \left( \frac{\text{m}^3}{\text{min}} \right) * \text{Tiempo (min)} = 1,67 * 10 \approx 17 \text{ m}^3$$

## 7.2 Capacidad de Diesel Oil (DO)

El diésel será empleado en los motores para la generación de la planta eléctrica. En esta fase del proyecto el balance eléctrico es preliminar y puede sufrir modificaciones, por lo que tomaremos la estimación realizada en el cuaderno 2, ya con la información de consumo específico de los generadores auxiliares duales.

Tomaremos una densidad del diésel  $\rho = 0,87 \text{ Tn/m}^3$

$$\text{Consumo DO} = \frac{\text{Autonomía}}{V_{servicio}} * \text{Consumo} \left( \frac{g}{kW} * h \right) * \text{Potencia} * \text{Régimen}$$

$$\text{Consumo DO} = \frac{12000}{14} * 182 * 1900 * \frac{1}{10^6} * 0,85 = 251,92 \text{ t}$$

$$V_{DO} = \left( \frac{251,92}{0,87} \right) + 10\% = 288,5 * 1,1 = 317,3 \approx 317 \text{ m}^3$$

### 7.2.1 Capacidad de almacenamiento del tanque de uso diario de DO:

Igual que en el caso del HFO, la capacidad de los tanques de uso diario de Diesel Oil viene definida por SOLAS y deberán estar duplicados también.

$$V_{SERV\_DO} = \frac{V_{DO}}{T_{NAV}} = \frac{317}{35} = 9,05 \approx 9 \text{ m}^3$$

### 7.2.2 Capacidad de almacenamiento del tanque de sedimentación de DO:

Se dimensiona el tanque de sedimentación para un mínimo de dos días de funcionamiento del motor:

$$V_{SED\_DO} = 9,05 * 2 = 18,1 \approx 18 \text{ m}^3$$

### 7.2.3 Capacidad de almacenamiento del tanque de reboses de DO:

Se estima de la misma forma que el tanque de reboses de HFO, pero suponiendo una velocidad de llenado del tanque de almacenamiento de DO acorde a la capacidad del mismo

(mucho mas pequeña). En este caso podemos suponer una velocidad de llenado de 20 m<sup>3</sup>/h.

$$V_{REBOSES\_DO} = V_{llenado} \left( \frac{m^3}{min} \right) * Tiempo \text{ (min)} = 0,33 * 10 \approx 3 \text{ m}^3$$

### 7.3 Capacidad de Gas Natural Licuado (GNL)

El consumo de GNL en principio se limitará a las estancias en puerto, pese a poder emplearse también en navegación al entrar en alguna zona con limitación de emisiones contaminantes, pero como esto resulta difícil de predecir, y además la calificación de estas zonas variará con el tiempo, supondremos que se usará solo en puerto.

Para decidir el emplazamiento del tanque almacén de GNL nos hemos basado en el “IGF CODE”, que en su parte A-1, apartado 5.2 Functional requirements establece:

*“.1 the fuel tank(s) shall be located in such a way that the probability for the tank(s) to be damaged following a collision or grounding is reduced to a minimum taking into account the safe operation of the ship and other hazards that may be relevant to the ship;*

*.2 fuel containment systems, fuel piping and other fuel sources of release shall be so located and arranged that released gas is lead to a safe location in the open air”*

Teniendo en cuenta esto hemos decidido situar el tanque almacén de GNL a centrado a popa de la habilitación del buque, y estamos limitados en manga por la regla:

*“The fuel tanks shall be located at a minimum distance of B/5 or 11.5 m, whichever is less, measured inboard from the ship side at right angles to the centreline at the level of the summer load line draught;*

where:

*B is the greatest moulded breadth of the ship at or below the deepest draught (summer load line draught) (refer to SOLAS regulation II-1/2.8). ”*

De modo que nuestro tanque no podrá tener un ancho superior a:

$$42,4 - 2 * (B/5)$$

Puesto que MAN no facilita el consumo exacto de los Generadores Diales, más allá de una estimación de consumo de GNL de 182 g/kW\*h, tomaremos ese dato.

Teniendo en cuenta que para descargar el barco empleará normalmente 4 días, y 3 para cargar con 1 día de margen por posibles malas situaciones de la mar o similares, la estancia media en puerto será de 8 días. Y supondremos que el buque podrá repostar GNL en 1 de cada 3 puertos entre los que opere.

La potencia de la planta de generación auxiliar empleada en puerto será de 1900 kW porque emplearemos 2 de los 3 generadores duales auxiliares y cada uno tendrá una potencia de 950 kW.

Tomaremos una densidad para el GNL de  $\rho = 0,45 \text{ Tn/m}^3$

$$\text{Consumo GNL} = \text{horas funcionamiento} * \text{Consumo} \left( \frac{g}{kW} * h \right) * \text{Potencia} * \text{Régimen}$$

$$\text{Consumo GNL} = 3 * 8 * 24 * 182 * 1900 * \frac{1}{10^6} * 0,85 = 169,30 \text{ Tn}$$

$$V_{GNL} = \left( \frac{169,3}{0,45} \right) + 5\% = 375 * 1,05 = 394,3 \approx 394 \text{ m}^3$$

## 7.4 Capacidad de aceite

Mantenemos la estimación del cuaderno 2 que establecía que el consumo de aceite se estimaba en el 3% del consumo total de combustibles (HFO, DO, GNL...)

Su densidad se toma como  $\rho = 0,90 \text{ Tn/m}^3$

$$\text{Consumo ACEITE} = 0,03 * (2627 + 288) = 87,45 \text{ Tn}$$

$$V_{ACEITE} = \frac{87,45}{0,9} = 97,16 \approx 97 \text{ m}^3$$

## 7.5 Capacidad del Tanque de Lodos

Estimaremos su capacidad basándonos en el MARPOL, el cual en su regla 17.1, apartado 4 (el aplicable a nuestro caso) establece:

*“Respecto de los buques que no lleven agua de lastre en los tanques de fueloil, la capacidad mínima del tanque de fangos (V1) se calculará mediante la fórmula siguiente:*

$$V1 = K1 * C * D \text{ (m}^3\text{)}$$

Siendo:

*K1 = 0,015 para los buques en los que se purifique el fueloil pesado destinado a la máquina principal, o bien 0,005 para los buques en que se utilice aceite diesel o fueloil pesado que no haya de ser purificado antes de su uso,*

$$C = \text{consumo diario del fueloil (m}^3\text{)}$$

*D = duración máxima ,en días, del viaje entre puertos en los que los fangos pueden descargarse en tierra. A falta de datos precisos, se utilizará la cifra de 30 días.”*

$$V_{LODOS} = K1 * C * D = 0,005 * 83 * 35 = 14,52 \approx 16 \text{ m}^3$$

## 7.6 Capacidad de agua dulce

El agua dulce que consumirá la tripulación se estimará mediante la relación:

$$\text{Consumo agua dulce} = 100 \text{ litros} * \text{tripulación} * \frac{\text{autonomía}}{\text{velocidad} * \text{horas}}$$

$$\text{Consumo agua dulce} = 100 * 30 * \frac{12000}{14 * 24} = 107142 \text{ litros} \approx 110 \text{ m}^3$$

### 7.6.1 Capacidad de agua dulce técnica

Para los distintos equipos instalados a bordo es necesario emplear agua dulce. Para este cometido estimaremos un tanque de 80 m<sup>3</sup> como suficiente para cubrir las necesidades del buque durante la navegación.

## 7.7 Capacidad de tanque de aguas grises y negras

Para el cálculo de aguas grises y negras se aplica la norma UNE-EN-ISO15749-1 de 2005.

Cuando se diseña una planta hay que considerar las cantidades mínimas de agua de desecho de acuerdo con la tabla 2 de la citada normativa.

**Tabla 2**  
**Cantidad mínima de agua de desecho**

Tipo de buque	Cantidad mínima de agua de desecho por persona y dia en litros			
	Planta sin vacío		Planta con vacío	
	Aguas negras	Aguas negras y grises	Aguas negras	Aguas negras y grises
Buques de pasaje	70	230	25	185
Buques de alta mar exceptuando los de pasaje	70	180	25	135

Los buques costeros pueden conservar los valores recomendados por las autoridades responsables.

NOTA – Estos valores son los recomendados. Hay que considerar las posibles variaciones debidas a los reglamentos nacionales o a las recomendaciones de las sociedades de clasificación.

Considerando que el sistema es una planta con vacío la producción total será:

$$V_{GENERADO} = 25 + 135 = 160 \text{ litros}/\text{Persona dia}$$

$$V_{AGUAS GRISES Y NEGRAS} = V_{GENERADO} * TRIPULACION * T_{NAV}$$

$$V_{AGUAS GRISES Y NEGRAS} = 160 \left( \frac{l}{pers dia} \right) * 30 * 35 = 168000 \text{ litros} \approx 168 \text{ m}^3$$

De todas formas es importante tener en cuenta que fuera de puerto y zonas restringidas es posible vaciar las aguas grises al mar, o en caso de contar con una planta de tratamiento de aguas grises este volumen podría reducirse hasta poder albergar el volumen generado en 4-5 días de navegación.

## 7.8 Capacidad de agua de lastre

El lastre necesario lo marcará el calado mínimo necesario para una navegación satisfactoria, esto se considera cuando el diámetro del propulsor se encuentra sumergido al menos al 96% en condiciones estáticas.

Nuestro calado mínimo será en torno a 9,5 m, para determinar el desplazamiento que corresponde a este calado nos apoyamos en las tablas hidrostáticas para calado 0, concretamente en el siguiente calado mayor a 9,5 m. Ese calado será 9,67 m y le corresponderá un desplazamiento de 89.800.

Teniendo en cuenta que el rosca de nuestro barco es de 22644 necesitaré un 67256 Tn de lastre, es decir, 70.000 Tn de agua de mar aproximadamente.

<b>Trimado 0</b>

Max deck inclination deg	0
Trim angle (+ve by stern) deg	0

$$M_{LASTRE}(Tn) = \Delta - P_{ROSCA}$$

$$M_{LASTRE}(Tn) = 89900 - 22644$$

$$M_{LASTRE}(Tn) = 67\,256\,Tn$$

Aplicandole una densidad de 1,025 T/m<sup>3</sup>

$$V_{AGUA\,LASTRE} = \frac{67\,256}{1,025} = 65615\,m^3$$

$$V_{AGUA\,LASTRE}(m^3) = 65615\,m^3$$

Este volumen de lastre lo obtenemos de sobra

empleando la bodega 4 (inundable) para lastrar,

y la Bodega 2 y 6 (parcialmente inundables) para lastrarlas aproximadamente al 15-20% de su capacidad. Esto requerirá una futura corrección por superficies libres que se realizará en el Cuaderno 5.

## 7.9 Capacidades finales tanques

En la siguiente tabla se recoge el volumen final de cada tanque, así como de cada una de las bodegas de carga, pudiendo comprobar la situación de los mismos en el **Anexo 2\_Plano Tanques**.

TANQUES Y CAPACIDADES

Estos volúmenes de cada tanque se han obtenido una vez definidos y conformados todos los tanques y tras realizar la “calibración” de los mismos, también con el software maxsurf, obteniendo así sus capacidades y diversos datos relativos a las superficies libres con distintos llenados del mismo.

Todo esto se adjunta en **Anexo 3\_Tank Calibration** debido a su gran extensión.

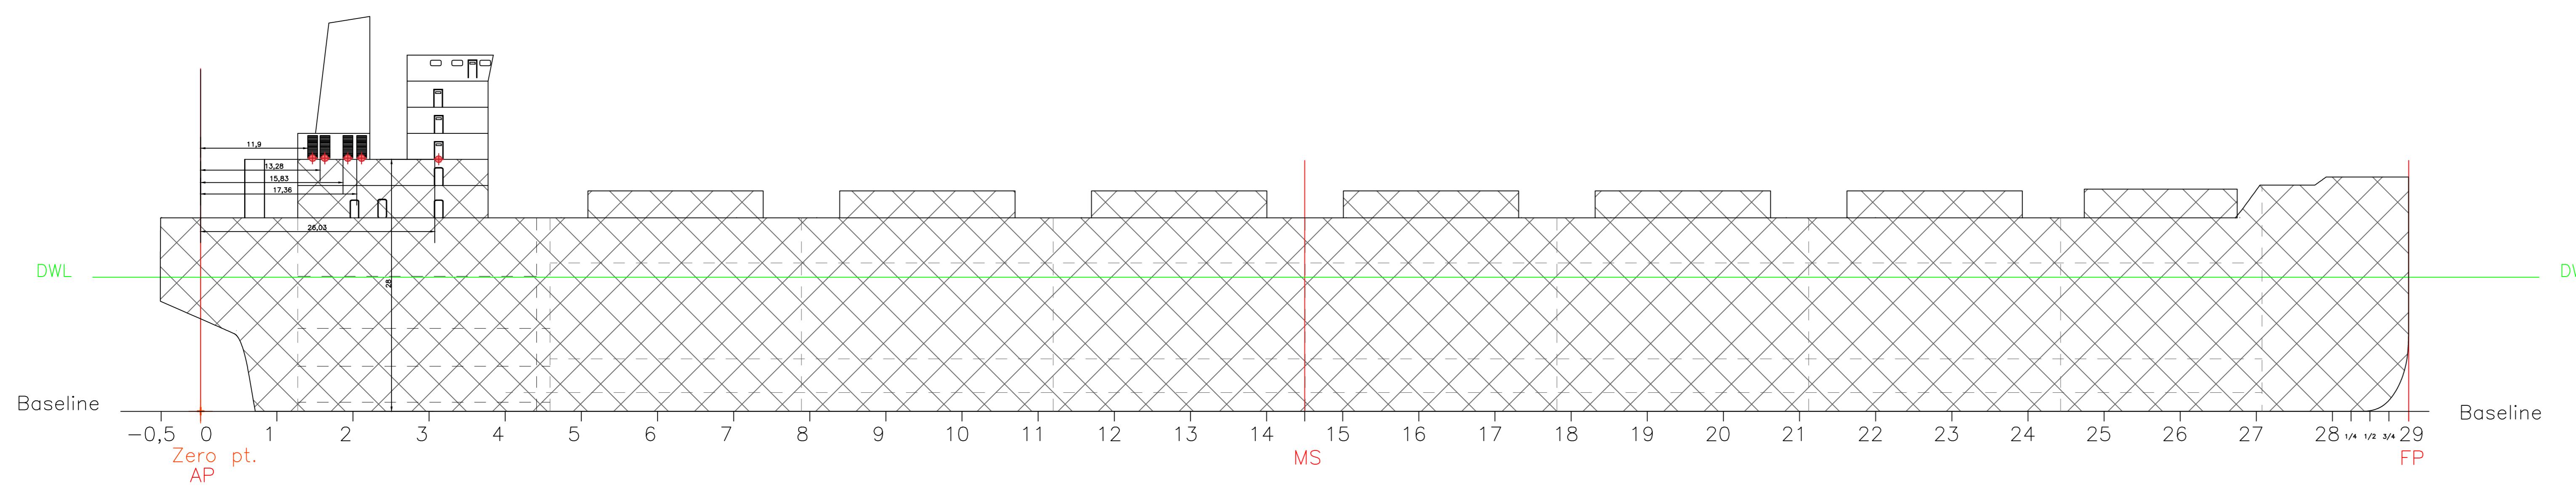

A modo de resumen se adjunta una tabla donde se recogen los volúmenes finales de cada servicio en comparación con los volúmenes mínimos necesarios calculados con anterioridad:

<b>RESUMEN</b>			
<b>Servicio</b>	<b>V Mínimo (m<sup>3</sup>)</b>	<b>V Real (m<sup>3</sup>)</b>	<b>Margen</b>
HFO almacen	2890	2940	50
HFO sed	123	130	7
HFO serv	81	97	16
HFO Reboses	17	23	6
DO almacen	317	335	18
DO sed	18	30	12
DO serv	9	16	7
DO Reboses	3	5	2
GNL almacen	394	409	15
Lube Oil	80	100	20
LODOS	16	27	11
Agua Dulce	110	155	45
Agua Técnica	80	85	5
Aguas Grises	168	195	27
Lastre	65700	86819	21119

Como podemos observar los márgenes son aceptables en todos los casos, se ajustan bastante al mínimo requerido a excepción del agua dulce que tiene cierto margen debido al beneficio estructural de hacer sus tanques de esas dimensiones.

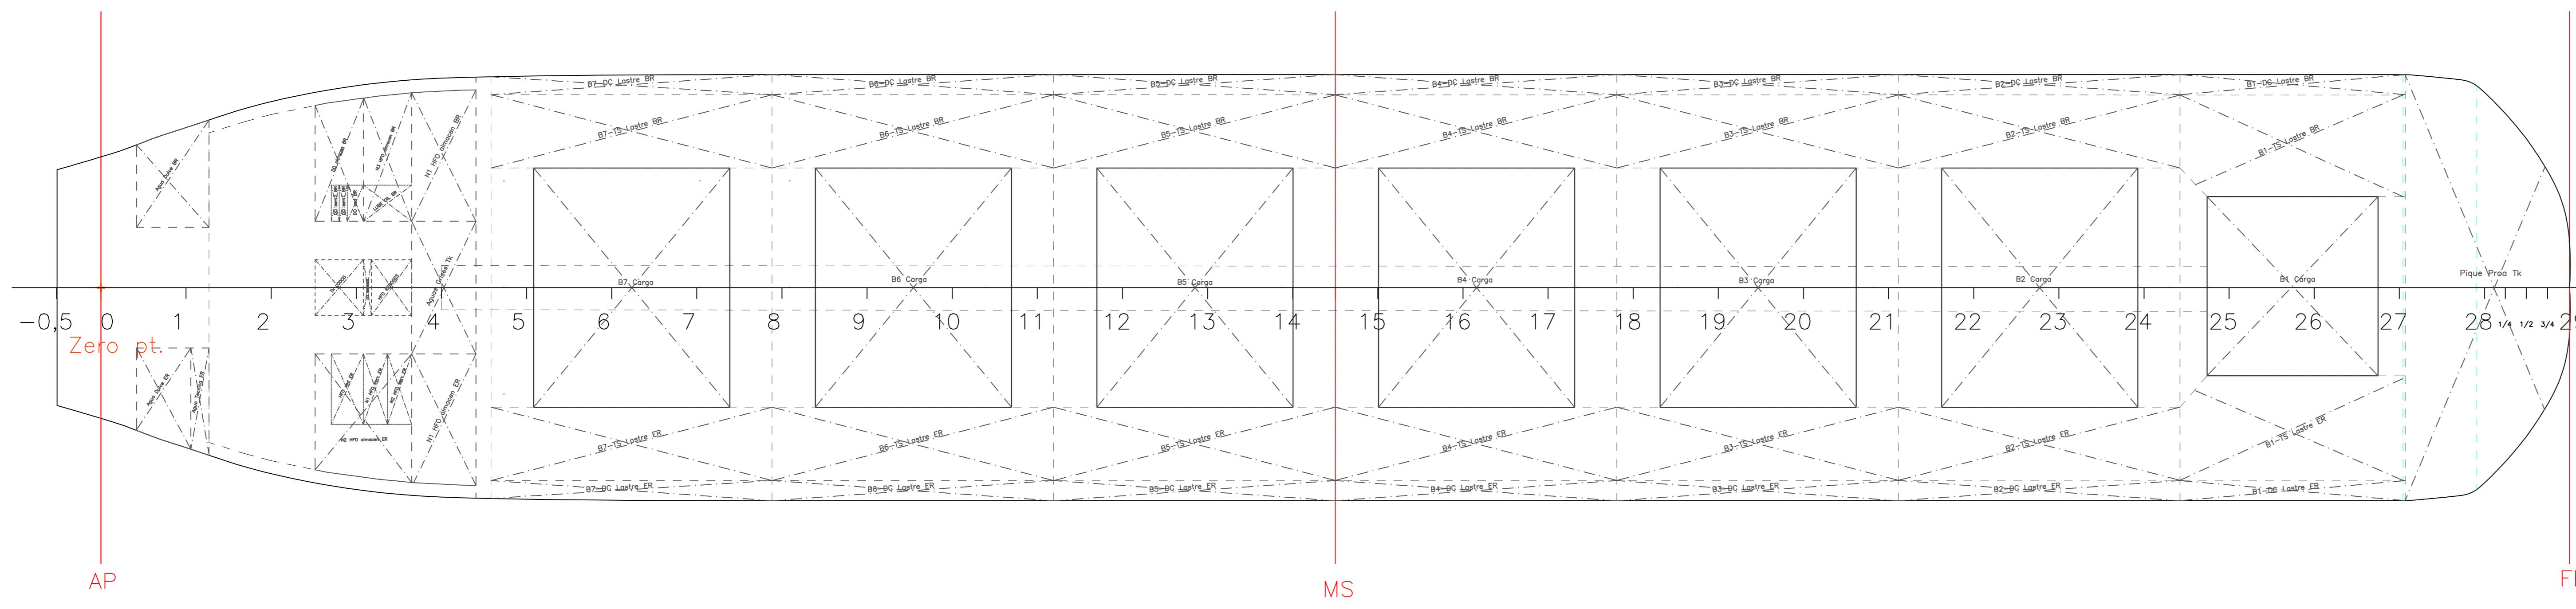

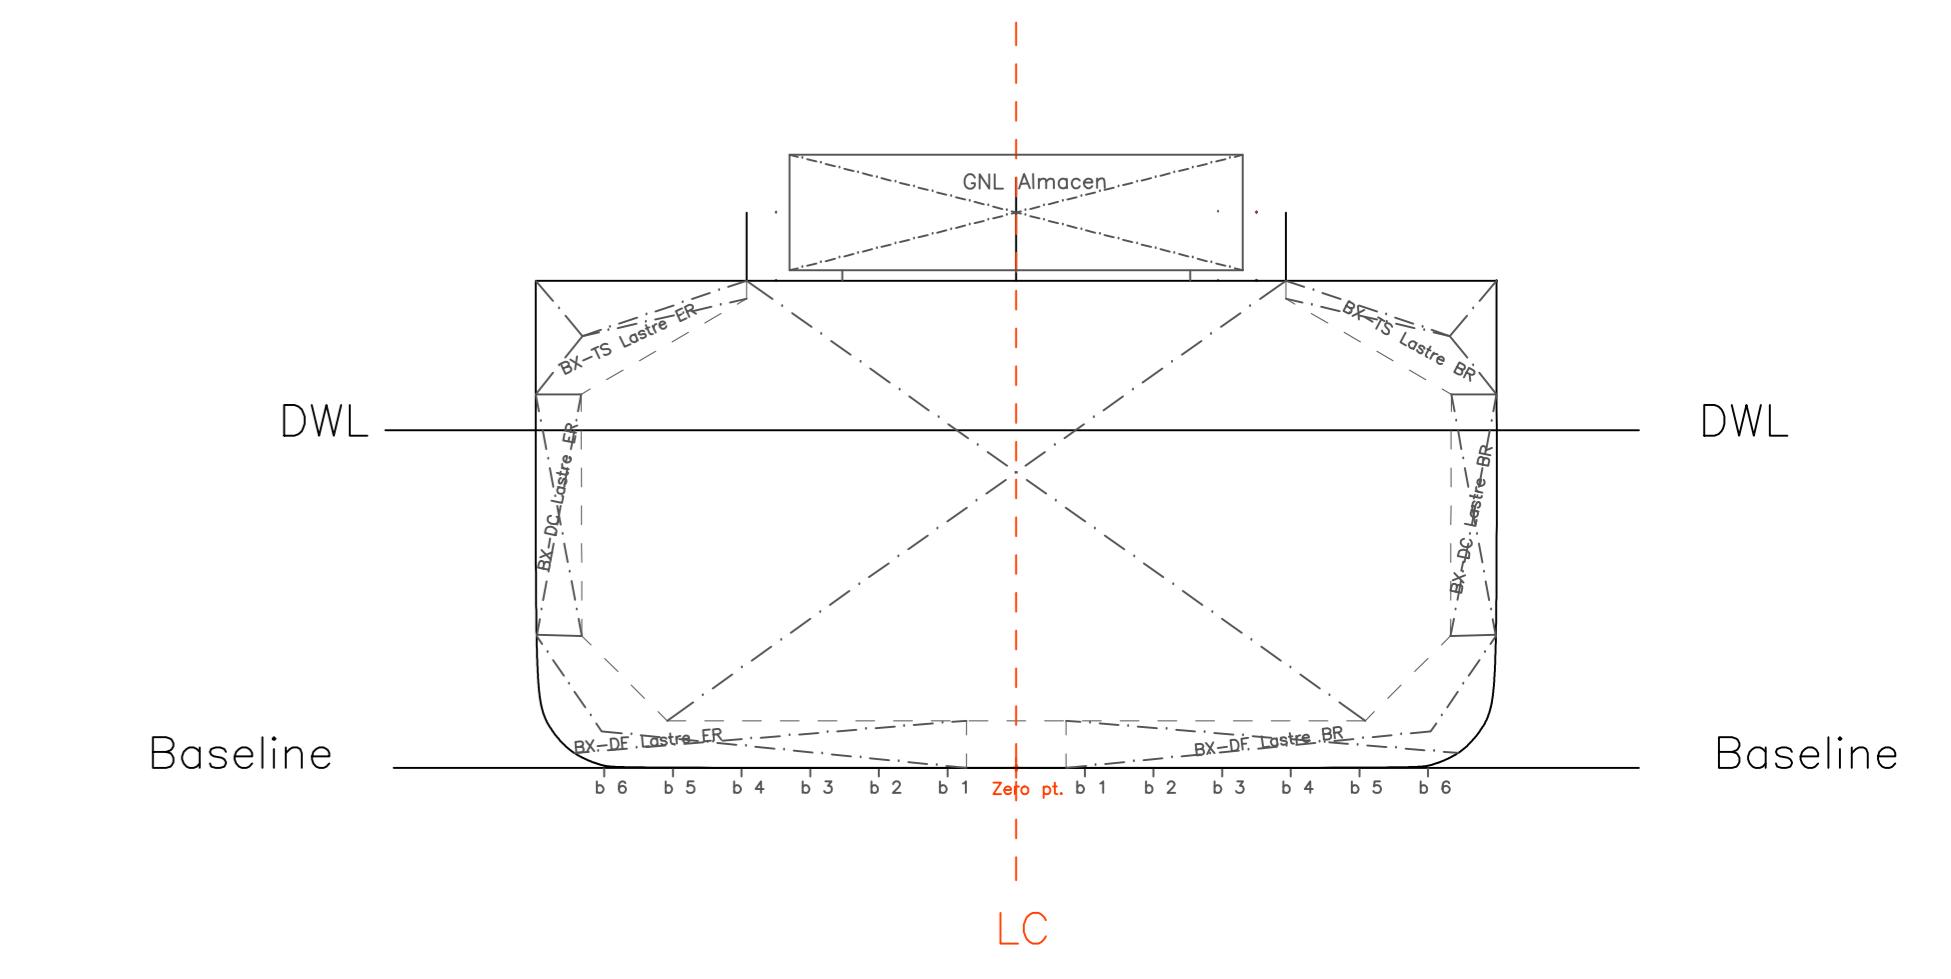

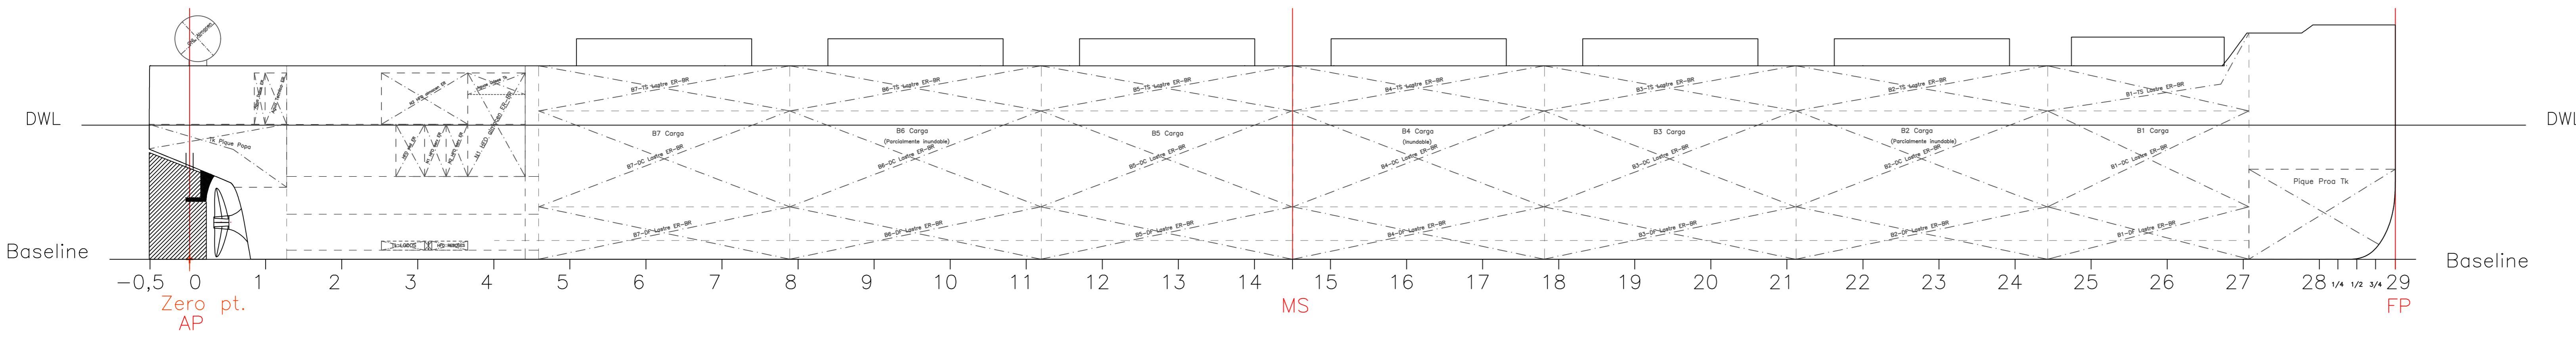

Cabe destacar que el margen del lastre se debe a que habrá 2 bodegas parcialmente inundables (B2 y B6 inundables un 25%) y una tercera inundable por completo (B4) a mayores de todos los tanques de lastre. Esto significa que habrá capacidad de sobra para albergar el lastre necesario, estimado anteriormente en torno a los 65.000 m<sup>3</sup>.
