BUQUE TANKER LNG 140000 M3 Y DISEÑO DE UNA PLANTA GENERADORA DE POTENCIA CON TURBINA DE GAS Y CICLO REGENERATIVO. RESUMEN

En primer lugar, se desarrollará el proyecto de un buque tanker LNG. La particularidad de este buque es su carga, ya que requieren unas características muy concretas, debido a su temperatura, presión y flash point.

Una vez completado el proyecto de diseño del tanker de LNG, se desarrollará el diseño de una planta de potencia para la propulsión del buque, que se estima en un mínimo de 25 MW, basada en turbina de gas regenerativa empleando el propio LNG transportado como combustible. Esta turbina de gas regenerativa operará con dos compresores con una etapa de enfriamiento entre ambas compresiones y los gases de escape calientes se emplearán para precalentar el aire comprimido antes de entrar en la cámara de combustión.

En el diseño de esta planta de potencia se dimensionarán tanto en enfriador con agua de mar como del intercambiador gases-aire. Se compararán los resultados obtenidos en función de cómo los parámetros de diseño (relación de compresión, temperatura máxima, caudal de aire...) afecten a la eficiencia térmica de la planta. La comparación con turbina de gas simple y motor diésel se llevará a cabo en términos de eficiencia, coste y emisiones, estableciéndose las posibles ventajas e inconvenientes

REQUISITOS PREVIOS DE OPERACIÓN. RPA

A continuación, se presentarán los requisitos previos iniciales en los que se basará el diseño del buque:

Tipo de buque

Buque Transporte de LNG - 140000 m³

Clasificación y cotas

SOLAS, CIG, Bureau Veritas, MARPOL

Características de la carga

Tanques membrana

Velocidad y autonomía

Velocidad servicio de 17,2 nudos, 85% MCR 10 MM. Autonomía 10.000 millas

Propulsión

Diesel eléctrico

Tripulación y pasaje

28 tripulantes

PARÁMETROS DE FORMA DEL BUQUE

A continuación, se muestra una tabla con los datos del buque que se han ido obteniendo en los cuadernos anteriores:

Parámetro	Valor	Unidad
Displacement	109400	t
Volume (displaced)	106732,163	m ³
Draft Amidships	12,200	m
Immersed depth	12,200	m

INTRODUCCIÓN

En el siguiente documento se definirá el compartimentado del buque proyectado, así como la localización y capacidad de cada tanque. A partir de esta información, se estudiarán también las curvas hidrostáticas, las curvas KN que ayudan a comprobar aspectos relacionados con la estabilidad del buque y se definirán las zonas estancas.

El compartimentados del buque se realiza siguiendo los siguientes tres apartados:

- Compartimentado longitudinal
- Compartimentado transversal
- Compartimentado vertical

Además, se en el compartimentado se diferenciarán las siguientes áreas:

- Zona de proa
- Zona de popa
- Zona de máquinas
- Zona de carga

Para la correcta realización del siguiente cuaderno, serán de importancia los siguientes reglamentos: MARPOL, SOLAS y la Sociedad de clasificación Bureau Veritas.

1 ESTRUCTURA LONGITUDINAL

A continuación, se definirá la estructura principal del buque en el sentido longitudinal, es decir, el número y separación entre cuadernas.

En la posición de algunas de esas cuadernas se encontrarán mamparos estancos transversales que se encargan de la subdivisión del volumen interior del buque en el sentido de la eslora. La característica principal de los mamparos estancos es que se extienden desde el fondo hasta la cubierta de francobordo del buque. Existen los siguientes mamparos con estas características:

- Mamparo pique de proa
- Mamparo pique de popa
- Mamparo pañol
- Mamparo cámara de máquinas

En los siguientes apartados se definirán los espacios que delimitan estos mamparos y además se indicará la posición de éstos.

1.1 Clara de cuadernas de trazado

La separación entre cuadernas no será constante a lo largo de toda la eslora del buque ya que existen zonas con una mayor complejidad en las formas, estas son el cuerpo de proa y el de popa.

Además, habrá que tener muy claro donde se encuentran las cuadernas, porque en siguientes apartados, cuando se sitúen los mamparos, éstos deben coincidir con cuadernas.

La sociedad de clasificación indicada en las RPA no hace indicaciones sobre este parámetro, tomaremos como referencia los valores el buque de referencia.

ZONA	SEPARACIÓN ENTRE CUADERNAS
Pique popa	500 mm
Cámara de máquinas	500 mm
Zona de carga	2000 mm
Pañol	2000 mm
Pique proa	500 mm

3 PUNTOS DE INUNDACIÓN PROGRESIVA

Los puntos de inundación progresiva son aberturas no estancas a la intemperie que están situadas por encima de la cubierta definida anteriormente.

Estos puntos se caracterizan porque si están sumergidos provocan una inundación progresiva, pero en casos de inmersión transitoria, como por ejemplo un golpe de mar, podrán resistir sin filtrar el agua. Limitan el ángulo de inundación.

Se considerarán como puntos de inundación progresiva los accesos a la superestructura y la ventilación de la cámara de máquinas

4 COMPARTIMENTADO TRANSVERSAL

En el apartado que se muestra a continuación se definirán las distintas zonas del buque, así como la localización de los mamparos estancos y de colisión. Estos mamparos han de coincidir con la localización de cuadernas y deben extenderse desde el fondo hasta la cubierta de francobordo y de babor a estribor.

El volumen interior del buque se divide en:

- Pique de popa
- Pique de proa
- Cámara de máquinas
- Zona de carga

4.1 Zona de proa

Esta zona se extiende desde el extremo de proa del buque hasta el extremo de proa de la zona de carga. Este espacio tiene las siguientes funciones:

- Espacio que protege la carga
- Zona de almacenamiento de lastre
- Zona de almacenaje para herramientas y equipos

4.1.1 Mamparo de colisión. Pique de proa

El reglamento SOLAS indica en el capítulo III:

“Se instalará un mamparo de colisión que será estanco hasta la cubierta de cierre. Este mamparo estará situado a una distancia de la perpendicular de proa no inferior al 5% de L o a 10 m, si esta segunda magnitud es menor, y, salvo cuando la Administración permita otra cosa, dicha distancia no será superior al 8% de L. Cuando cualquier parte del buque que quede debajo de la flotación se prolongue por delante de la perpendicular de proa, como por ejemplo ocurre con una proa de bulbo, las distancias estipuladas en el párrafo 2 se medirán desde un punto situado:

- A mitad de dicha prolongación.
- A una distancia igual al 1,5% de la parte de la eslora del buque que quede por delante de la perpendicular de proa.
- A una distancia de 3 m por delante de la perpendicular de proa.

Tomándose de esas medidas la menor. “

A continuación, se define la eslora que se utilizará, se tomará el valor mayor de los dos que se indican:

1. 96% de la eslora total al 85% el puntal, desde el extremo de roda hasta el extremo del codaste.

$$96\% \text{ de } 264 = 253.44 \text{ m}$$

2. Eslora total al 85% del puntal, desde el extremo de la roda hasta el eje de la mecha del timón.

$$100\% \text{ de } 260.72 \text{ m}$$

Escogiendo la mayor, la eslora que se utilizara en los cálculos se define como:

$$L = 260.72 \text{ m}$$

El mamparo de colisión se sitúa a una distancia mínima del 5% de L o 10 metros, escogiendo la menor, por tanto:

$$\min\{5\% 260.72, 10\ m\} = \min\{13.036, 10\ m\} \rightarrow 10\ metros$$

En el caso del buque proyectado hay que tener en cuenta el bulbo de proa, se considerará la mitad de las siguientes dimensiones:

1. Mitad de la protuberancia:
50% de 6.1 = 3.05 m
2. 1.5% de la eslora.
1.5% L = 3.96 m
3. 3 metros

Escogiendo el valor mínimo de los 3 calculado, y restándosele a la primera posición del mamparo de colisión calculado, resulta:

$$10 - 3 = 7\ m$$

La distancia mínima donde debe estar el mamparo de colisión resulta:

$$d_{MIN} = 260.72 - 7 = 253.72\ m$$

Además, el reglamento indica el máximo, que no puede exceder el 8% de la eslora calculada, repitiendo el cálculo:

$$8\% de L = 21.12\ m$$

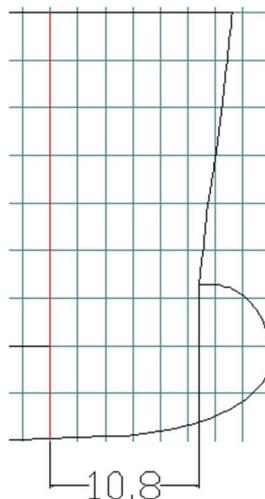

Teniendo en cuenta el bulbo de proa instalado:
21.12 - 3 = 18.12 m

Resultando,

$$d_{MAX} = 260.72 - 18.12 = 242.6\ m$$

Concluyendo, el mamparo de colisión debe situarse entre 253.72 y 242.6 metros, haciéndolo coincidir con una cuaderna:

Mamparo de colisión

Pique de proa

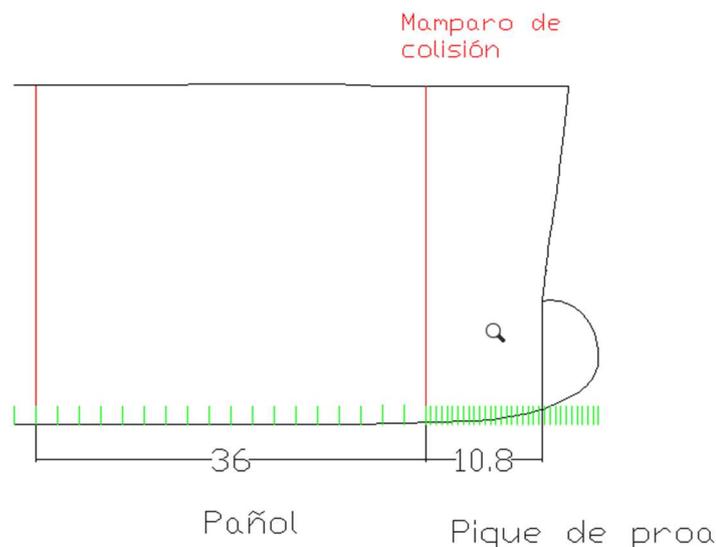

El mamparo se localizará a 10.8 m de la perpendicular de proa, estando dentro del rango establecido (7, 17.86 m), a 244 metros de la perpendicular de popa. Se hará coincidir dicho mamparo con la cuaderna de trazado número 185.

4.1.2 Pañol

Existirá una zona dedicada al almacenaje de herramientas y equipos, además de tener una zona dedicada a agua de lastre y el almacenaje de combustible, ya que debido a la autonomía del buque será necesario almacenar el combustible fuera de la cámara de máquinas ya que son grandes tanques, teniendo después cerca de los motores un tanque de uso diario. Además, cumpliendo con el reglamento MARPOL, no se podrá almacenar este combustible en dobles fondos o dobles cascos.

Este tendrá una longitud de 36 metros, estará delimitado por el mamparo de colisión del pique de proa (Situados en la cuaderna 185) y por un mamparo estanco en la cuaderna 167 que lo separa de la zona de carga. Se sitúa a 208 metros de la perpendicular de popa.

A continuación, se observa un esquema de este compartimento:

4.2 Zona de popa

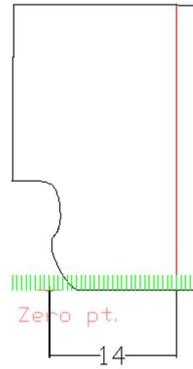

4.2.1 Pique de popa

El pique de popa está delimitado por un mamparo estanco que es necesario para separar tanques de lastre y otros fluidos de la cámara de máquina.

No existen indicaciones en el reglamento respecto su ubicación, pero si que se estima que debe estar localizado al 4% de L de la perpendicular de popa, aproximadamente, y no interesa excederse demasiado en este valor ya que los dos espacios restantes (Zona de carga y cámara de máquinas) necesitan un espacio amplio. Este valor en el caso del buque proyectado es:

$$4\% \text{ de } L = 10.2 \text{ metros}$$

En el caso del buque proyectado el valor será de 14 metros, haciéndolo coincidir así con la cuaderna número 28, extendiéndose desde la cuaderna -8.

Pique de popa

4.3 Cámara de máquinas

La cámara de máquinas está situada entre el pique de popa y la zona de carga. En este compartimento se situarán tanques de almacenaje de uso diario y los equipos necesarios para el funcionamiento del buque.

La eslora de la cámara de máquinas se estimará a partir de una expresión, en este momento seremos generosos con este espacio, siempre que el espacio de carga sea suficiente, ya que en buques de este tamaño la maquinaria es muy grande y hay que disponer de espacio suficiente para maniobrar en caso de avería o respetos.

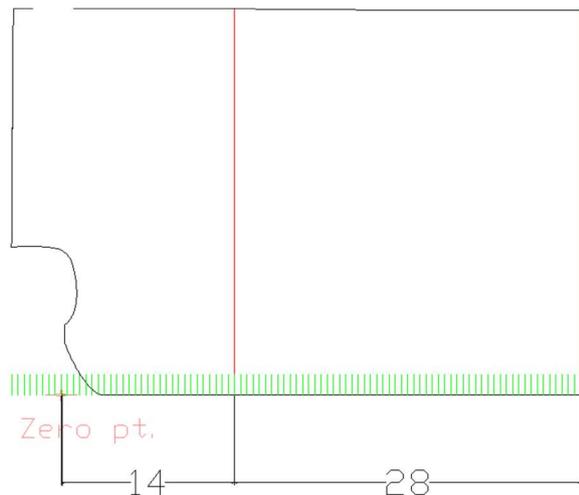

En el libro "Proyecto del buque mercante" se indica:

$$L_{CM} = 0.28 \times L_{pp}^{0.67} + 0.48 \times [kW]^{0.35} = 0.28 \times 255.1^{0.67} + 0.48 \times 22346^{0.35} = 27.5 \text{ m}$$

Haciendo coincidir el mamparo de proa de la cámara de máquinas con una cuaderna, se establece:

$$L_{CM} = 28 \text{ metros}$$

Coincidiendo dicho mamparo que separa la cámara de máquinas y la zona de carga en la cuaderna 84, a 42 metros de la perpendicular de popa.

Pique de popa

4.4 Zona de carga

En la zona de carga se albergará el gas natural licuado a transportar. Durante el diseño el volumen será la medida crítica para determinar si el compartimentado es adecuado y el buque es capaz de albergar toda la carga a transportar.

En primer lugar, se hará referencia a la compartimentación vertical y longitudinal de este espacio, es decir, doble fondo, doble casco y cofferdams. Después se definirán los tanques de carga.

La zona de carga se extiende desde los 42 metros de la perpendicular de popa a los 206 metros de la perpendicular de popa.

4.4.1 Cofferdams

En los espacios de carga debe de existir un espacio vacío que sirva de separación entre tanques y entre distintos compartimentos, estos espacios se llaman cofferdams y deben de ir vacíos, esto quiere decir, que no se podrán usar como tanques de lastre, etc.

En el buque del proyecto tendrán un espaciado de 4 metros. A continuación, se muestran en una tabla dónde estarán situados, y en el plano del compartimentado del anexo se pueden observar.

COFFERDAM	SITUACIÓN
Cofferdam 1	Entre cámara de máquinas y tanque de carga 1
Cofferdam 2	Entre tanque de carga 1 y 2
Cofferdam 3	Entre tanque de carga 2 y 3
Cofferdam 4	Entre tanque de carga 3 y 4
Cofferdam 5	Entre tanque de carga 4 y almacén

4.4.2 Tanques de carga

El convenio MARPOL, capítulo 4, indica que la eslora de los tanques de carga debe ser como máximo:

$$L_{MaxTanque} = \left(0.25 \times \frac{bi}{B} + 0.15 \right) \times L$$

Siendo "bi" la distancia desde el costado del buque al mamparo longitudinal exterior que delimita el tanque. En el caso del buque proyectado coincide con la anchura del doble casco. Resulta:

$$L_{MaxTanque} = 41.3 \text{ m}$$

Con el objetivo de que los mamparos transversales que dividen los tanques coincidan con las cuadernas de la zona de carga, se establece una eslora de tanque de entre 36 y 38 metros.

TANQUE		Eslora Tanque	Posición mamparo Proa - Posición mamparo popa	Cuaderna proa - Cuaderna Popa
Tanque 1	A	38	46 - 84	86 - 105
	B			
Tanque 2	A	36	88 - 124	107 - 125

	B			
Tanque 3	A	36	128 - 164	127 - 145
	B			
Tanque 4	A	36	168 - 204	147 - 165
	B			

Se comprueba que cumple con la eslora máxima indicada por MARPOL de 41,3 metros,

5 COMPARTIMENTACION VERTICAL

5.1 Doble fondo

A lo largo de la zona de máquinas, la zona de carga y el pañol se extenderá el doble fondo del buque.

La sociedad de clasificación indicada en las RPA de proyecto indica que la altura mínima del doble fondo es de 0,7 metros, y citando:

“La altura del doble fondo debe ser suficiente para asegurar el acceso a todas las partes, y, en el camino de la viga central, debe ser de no menos de 0.7 metros”

Además, para hacernos una idea de la altura que ha de tener el doble fondo, según indica el Marpol en el capítulo 3, regla 12, la altura mínima ha de ser al menos de las que se indican a continuación:

$$H_{Min_{DF}} = \min\left\{\left(\frac{B}{15}\right), 2\right\} = \min\{2.8, 2\} = 2 \text{ metros}$$

Tomaremos 2.5 metros como altura del doble fondo y se extenderá desde el mamparo del pique de proa hasta el mamparo del pique de popa, sin incluir ambos piques. Este espacio será destinado al transporte de consumibles y tanques de lastre.

5.2 Cubiertas en cámara de máquinas

La cámara de máquinas tendrá en primer lugar el doble fondo en el cual se encontrarán los tanques de aguas grises y lodos, en segundo lugar, hasta los 12,5 metros, se encontrará el motor propulsor, después se encontrará el grupo electrógeno hasta los 22,5 metros, por último, existirá una cubierta destinada a los tanques de combustible, aceite, etc.

5.3 Cubiertas en pañol

En el pañol al igual que en el resto de las zonas existirá un doble fondo, después se dispondrá hasta los 14,5 metros se dedicará al agua de lastre, a lo largo de los cuatro metros siguientes se dispondrán los tanques de combustible y por último existirá un espacio de almacenamiento de equipos.

6 COMPARTIMENTACIÓN LONGITUDINAL

6.1 Doble casco

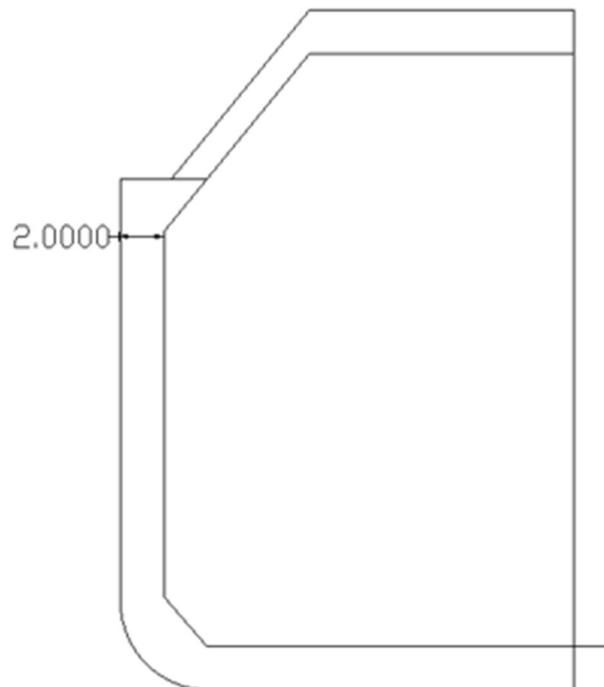

En los buques de transporte de gas natural licuado es obligatorio la existencia de doble casco, y tal y como indica el Código Internacional de Gasero, éste no puede ser de menos de 0.76 metros.

El reglamento SOLAS indica un valor de referencia para buques de carga:

$$e_{DC} = \frac{B}{20} = 2 \text{ metros}$$

En el caso de proyecto se indica que el espesor del doble casco será de 2 metros y que será dedicado a tanques de lastre.

A continuación, se muestra una imagen de la situación del doble casco:

6.2 Mamparos longitudinales

En crujía del buque de proyecto, a lo largo de la zona de carga y del pañol, se dispondrá de un mamparo longitudinal que divide el buque en dos partes simétricas, de esta forma los consumos, la carga, etcétera se divide en dos partes iguales, por tanto, en caso de accidente en una de las partes, la otra puede seguir funcionando.

7 JUSTIFICACIÓN DE LA CAPACIDAD DE TANQUES

En este apartado del documento se calculan el volumen mínimo que debe ser transportado de cada consumible para cumplir con la autonomía del buque, que según se indicó anteriormente era de aproximadamente 24 días.

Después, se comprobará que la disposición y compartimentado propuestos permiten transportar los mínimos calculados previamente.

Los tanques que se estudian son los que se muestran a continuación:

- Tanque de combustible
- Tanque de aceite
- Tanque de lodos
- Tanque de aguas grises
- Tanque de aguas negras
- Tanque de agua dulce
- Tanques de carga
- Tanque de lastre

7.1 Tanque de lastre

Los tanques de lastre existen para almacenar agua cuando sea necesario corregir el trimado, mejorar las condiciones de estabilidad y facilitar la navegación, este proceso es necesario cuando el mar es complicado, se han gastado los consumos o el buque navega en vacío.

Estos tanques se situarán de forma simétrica, y como se mencionó anteriormente, se localizarán en el doble fondo, doble casco y piques de proa y popa.

Para determinar el lastre mínimo necesario se parte de la premisa de que el buque debe ser capaz de garantizar que la hélice quede totalmente sumergida, para ello, el calado mínimo ha de ser:

$$T_{Min} = D_{Helice} + 0.1 \times D_{Hélice} = 8.8 + 0.1 \times 8.8 = 8.9 \text{ m}$$

A partir del calado mínimo, se calcula el desplazamiento mínimo.

$$\Delta_{Min} = Cb \times Lpp \times B \times T_{Min} \times \rho = 78511,8 \text{ Ton}$$

Por tanto, el peso del agua de lastre:

$$P_{Lastre} = \Delta_{Min} - P_{Rosca} - Otros$$

Dentro de otros tenemos la tripulación y pertrechos al 100%, los lodos, aguas residuales al 90%, y por último el resto de los consumos al 10%. Tomando estos datos del cuaderno 2, este valor asciende a aproximadamente 300 toneladas.

$$P_{Lastre} = 78511,8 - 36219,93 - 300 = 41991,85 \text{ ton}$$

$$V_{Lastre} = \frac{41991,85}{1.025}$$

$$V_{Lastre} = 40967,7 \cong 41000 \text{ m}^3$$

Este es el valor mínimo y se pretende, siempre que sea posible, que sea superior al mínimo calculado, para asegurar así que la hélice estará siempre sumergida y evitar así posibles problemas.

7.2 Tanque de combustible

En el cuaderno 11 se escogen unos motores generadores cuyo consumo se indica que es 177.2 g/kWh, por tanto, a partir de la autonomía y del consumo se estima:

$$\begin{aligned} \text{ConsumoReal} &= \text{Autonomía}[h] \times n^{\circ} \text{generadores (en funcionamiento)} \times \text{Consumo} \\ &\times \text{Potencia}[kW] \times \frac{1}{10^6} = 581.4 * 177.2 * 3 \times 14400 \times \frac{1}{10^6} = 3783 \text{ Ton} \end{aligned}$$

Siendo la densidad del combustible 0.85 tn/m³, se obtiene un volumen de combustible necesario:

$$V_{Comb} = 4450.6 \text{ m}^3$$

➤ TANQUE PAÑOL

Se instalarán dos tanques almacén en proa, con una capacidad total del volumen de combustible total menos el consumo de dos días.

El combustible que se consume en dos días se calcula de la siguiente forma:

$$\begin{aligned} \text{Consumo}_{2D} &= 48h \times 3 \times 0.85 \times 14400 \times 177.2 = 312325632 \text{ g} = 312.3 \text{ toneladas} \\ &= 367.44 \text{ m}^3 \end{aligned}$$

Por tanto, la capacidad de cada tanque de combustible del almacén resulta:

$$\text{Capacidad}_{\text{TanqueAlm}} = \frac{4450.6 \text{ m}^3 - 367.44 \text{ m}^3}{2} = 2042 \text{ m}^3$$

➤ TANQUE DE SEDIMENTACION

El tanque de sedimentación es el tanque intermedio entre los tanques de combustible en el almacén y el tanque de uso diario, por tanto, tendrán una capacidad capaz de suministrar el combustible al tanque de uso diario, que en el caso proyectado se ha dimensionado para 2 días. Se localizará en cámara de máquinas y su capacidad será:

$$V_{\text{TanqueSedimentacion}} = 370 \text{ m}^3$$

➤ TANQUE DE USO DIARIO

El tanque de uso diario se sitúa en cámara de máquinas y tendrá capacidad para albergar el combustible necesario para dos días de navegación, por tanto:

$$V_{\text{UsoDiario}} = 370 \text{ m}^3$$

7.3 Tanque de aceite

Observando el consumo de aceite indicado en los datos técnicos del motor, y teniendo en cuenta que el buque lleva a bordo 4 motores:

$$C_{\text{Aceite}} = C_e * Pot * t_{Nav} = 0.5 \frac{g}{kW} * 581.4 \text{ h} * 32000 * 10^{-6} = 9.3 \text{ Toneladas}$$

Teniendo en cuenta la densidad del aceite que es 0.9 ton/m³:

$$V_{\text{Aceite}} = \frac{9.3}{0.9} = 10.33 \text{ m}^3 \text{ (TOTAL TODOS LOS MOTORES)}$$

Se instala un tanque de aceite en la cámara de máquinas.

7.4 Tanque aguas grises y negras

Se estima en la norma UNE 15749 que cada tripulante genera al día 180 litros de aguas sucias, por tanto, en el caso del buque proyectado resulta:

$$V_{AguasSucias} = 126000 \text{ litros} = 126 \text{ m}^3$$

Se coloca un tanque en el doble fondo de la cámara de máquinas.

7.5 Tanque de lodos

Para dimensionar este tanque se utiliza la normativa MARPOL, que estima:

$$V_{TLodos} = k * C * D$$

Siendo,

- "k" un factor que toma el valor de 0.01 los buques que utilizan fuel oil en las maquinas principales.
- "C" el consumo diario de fuel
- "D" el tiempo máximo que esta el buque sin parar en puerto se tomara como la autonomía del buque.

Resulta:

$$V_{TLodos} = 0.01 * 185 * 25$$

$$V_{TLodos} = 46.25 \text{ m}^3 \text{ (TOTAL)}$$

Este tanque se localizará también en el doble fondo de la cámara de máquinas.

7.6 Tanque agua dulce

Se utiliza la norma UNE ISO 15748 para estimar el consumo de agua dulce en el buque, esta norma aproxima a 175 litros de agua dulce consumida por persona y día:

$$V_{AD} = 175 * 25 * 28 = 122500 \text{ litros} = 122.5 \text{ m}^3$$

7.7 Comprobación capacidad de tanques

A continuación, se muestra una tabla donde se calcula la capacidad de los tanques que se definieron anteriormente. Esto se realiza con ayuda de Maxsurf Stability:

Cuaderno 4: Arquitectura naval
Marina de la Peña Herrero

Item name	Specific gravity	Total mass [Tonne]	Total volume [m3]	Long. Arm [m]	Trans. Arm [m]	Vert. Arm [m]	Total FSM [tonne.m]

Con el objetivo de comprobar si los tanques establecidos satisfacen los mínimos establecidos a lo largo del apartado 3 de este documento, se muestra a continuación una tabla comparativa con las capacidades mínimas agrupadas:

TANQUE	MÍNIMO [m3]	C4 [m3]
Combustible almacén 1	2042	2554.35
Combustible almacén 2	2042	2554.35
Combustible uso diario	370	441
Combustible sedimentación	370	441
Aceite cámara de máquinas	10,33	31.36
Aguas grises y negras	126,5	267.1
Lodos	46,25	264.9
Agua dulce	122,5	211.7
LASTRE TOTAL	41000	53152.6
Pique proa		6626.9
Pique popa		11221.3
Doble fondo		15526.3
Almacén		12766.1
Doble casco		7012
CARGA TOTAL	140000	147561.4
Carga 1A		19273.8
Carga 1B		19307.5
Carga 2A		18433.8
Carga 2B		18433.8
Carga 3A		18433.8
Carga 3B		18433.8
Carga 4A		18433.8
Carga 4B		18433.8

Como se indicó con anterioridad, el volumen de lastre es superior al mínimo establecido para así asegurar que la hélice funcionara completamente sumergida en todo momento.

Maxsurf establece una capacidad de carga total de 149217.8 metros cúbicos. Que este valor sea superior a lo establecido en las RPA del proyecto se debe a la permeabilidad y al límite de llenado de los tanques. Se muestra a continuación el cálculo:

- La permeabilidad es de 0.97, y teniendo en cuenta que se requiere una capacidad de 140000 metros cúbicos:

$$V = \frac{140000}{0.97} = 144329.9 \text{ m}^3$$

- Además, según el código internacional de gaseros (CIG) establece el límite de llenado al 98%:

$$V = \frac{144329.9}{0.98} = 147275.4 \text{ m}^3$$

Se comprueba de esta forma que el volumen cumple con lo establecido en las RPA del proyecto.

8 HIDROSTÁTICAS

Los asientos indicados en Maxsurf Stability para el cálculo corresponden con aproximadamente el 1.5% de la eslora del buque proyectado. Se comprueban los asientos por proa y por popa, por tanto, en el programa hay que indicar los valores en positivo y en negativo.

En el caso de proyecto se comprobarán los asientos comprendidos en el rango $[-4, 4]$, con un intervalo de 0.5.

Se calculará para distintos valores de calados. Con el objetivo de responder a todas las posibles situaciones, el rango de calados a tener en cuenta será aquel que comprenda desde unos desplazamientos inferiores al peso en rosca calculado en el cuaderno 2 (36219.9 Toneladas) hasta un calado ligeramente superior al que se indicó en cuaderno 3 en Maxsurf Modeler (12. metros).

A continuación, se presentan los informes proporcionados por el Software para cada caso.

9 CURVAS KN

En este apartado se lleva a cabo el cálculo de las curvas KN, se debe mantener los valores de referencia establecidos en el apartado anterior en cuanto a calados y asientos.

Además, se debe comprobar la simetría del buque e indicarlo, para ello se comprueba si el valor de TCB en el apartado "Equilibrium" de Maxsurf Stability es igual a cero. En nuestro caso, se cumple.

Por último, se debe indicar la altura del centro de gravedad (KG), en este momento del proyecto, al no haber calculado aun las distintas condiciones de carga, el único valor KG calculado es el del peso en rosca, por tanto, se tomará un valor ligeramente inferior como aproximación para el cálculo de las curvas KN.

A continuación, se muestran los informes obtenidos por el programa como resultado de las curvas KN para cada caso.
