TRABAJO FIN DE GRADO

CURSO 2017/2018

PETROLERO SUEZMAX 148.000 TPM

Grado en Ingeniería Naval y Oceánica

Cuaderno 4

CÁLCULOS DE ARQUITECTURA NAVAL

GRADO EN INGENIERÍA NAVAL Y OCEÁNICA
TRABAJO FIN DE GRADO

CURSO 2.016-2017

PROYECTO NÚMERO 17-12

TIPO DE BUQUE: Petrolero Suezmax 148000 TPM

CLASIFICACIÓN, COTA Y REGLAMENTOS DE APLICACIÓN: DNV, MARPOL, SOLAS, CONVENIO DE LINEAS DE CARGA TIER 3

CARACTERÍSTICAS DE LA CARGA: 148000 TPM. Transporte de petróleo CRUDOS Y DERIVADOS.

VELOCIDAD Y AUTONOMÍA: 15,8 nudos con 85%MCR+ 15% margen de mar

SISTEMAS Y EQUIPOS DE CARGA / DESCARGA: Bombas de carga y descarga en los tanques de carga. Calefacción en tanques de carga.

PROPULSIÓN: Motor diésel directamente acoplado.

TRIPULACIÓN Y PASAJE: 30 personas

OTROS EQUIPOS E INSTALACIONES: Los habituales en este tipo de buques.

Ferrol, 10 Setiembre 2016

ALUMNO/A: Dª PABLO MARTÍNEZ MARTÍNEZ

Fernando Junco Ocampo

1 INTRODUCCIÓN

Para el estudio del buque proyecto, se dividirá el mismo en las siguientes zonas:

- Zona de Proa.
- Zona de Popa.
- Zona de Carga.
- Zona de Máquinas.

Esta disposición debe cumplir con las normas impuestas por la IMO, en este caso el SOLAS, MARPOL y la sociedad de clasificación DNV.

Las dimensiones del buque obtenidas en el cuaderno 3 son:

Lpp (m)	273,5
B (m)	45,3
D (m)	24
T (m)	17,7
Cb	0,866
Cm	0,992
Cp	0,873
Fn	0,157
Pot (Kw)	19350
Δ (t)	195606
Peso en Rosca (t)	28876
TPM	148.000

1.1. Mamparos estancos.

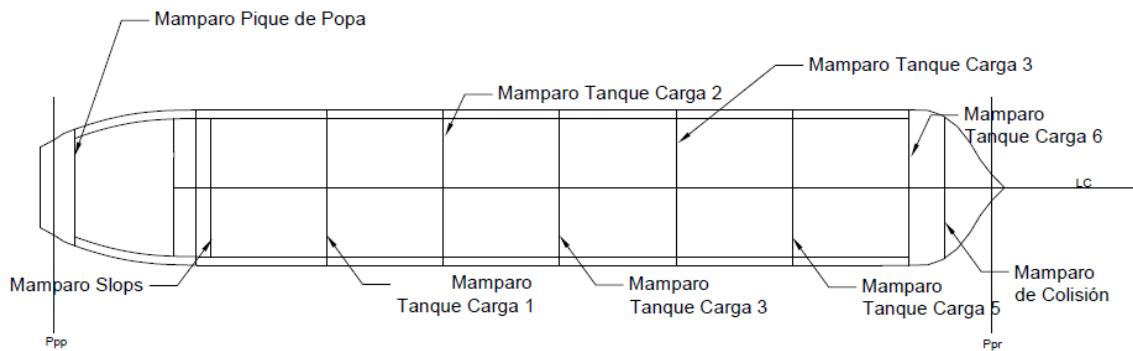

Según DNV en Pt3 Ch1 Sec3 A300, el buque se diseñará con 9 mamparos estancos, que se extienden desde el doble fondo hasta la cubierta de francobordo.

Ship length in m	Engine room	
	Aft	Elsewhere
85 < L ≤ 105	4	5
105 < L ≤ 125	5	6
125 < L ≤ 145	6	7
145 < L ≤ 165	7	8
165 < L ≤ 190	8	9
190 < L ≤ 225	9	10
L > 225	specially considered	

Estos mamparos son los siguientes:

- Mamparos Transversales:
 - Mamparo de Pique de Popa.
 - Mamparo de popa de los tanques Slop.
 - Mamparo de los tanques de carga (6 mamparos).
 - Mamparo de Pique de Proa o Mamparo de colisión.
- Además de los mamparos transversales, el buque llevará un mamparo longitudinal situado en crujía, que ayuda a la estabilidad en operaciones de carga y descarga.

El esquema de estos mamparos es el siguiente:

1.2. Separación entre cuadernas.

Para la separación entre cuadernas, cumpliendo con las separaciones máximas y mínimas permitidas por el DNV, se diferencian 3 zonas de espaciado de cuadernas que son:

- Zona 1: desde el espejo de popa hasta el mamparo de popa de los tanques slops, el cual está situado a 36 metros desde la Perpendicular de Popa. La separación entre cuadernas es de 750 mm:

- Cuadernas: de la -5 hasta la 53.
- Zona 2: desde el mamparo de popa de los tanques slops hasta el mamparo de colisión, situado a 258,35 metros de la Perpendicular de Popa. La separación entre cuadernas es de 1000 mm.
 - Cuadernas: de la 53 a la 277.
- Zona 3: desde el mamparo de colisión hasta el final del casco. La separación entre cuadernas es de 700 mm.
 - Cuadernas: de la 277 a la 315.

En cuanto a la separación entre bulárcamas se tomará un espacio entre cada una de cinco claras de cuadernas (5000 mm) para la zona de carga (cuadernas 83-277). En la zona de popa la separación entre bulárcamas será de 4 claras de cuaderna que va de la -5 a la cuaderna 53.

2 ZONA DE PROA.

Esta zona, que se extiende a proa de la zona de carga y va hasta el final del buque por la parte delantera, se usará para:

- Crear un compartimento de protección de la zona de carga.
- Alojar un tanque de lastre (pique de proa) que es de gran utilidad para corregir trimados.
- Zona donde se encuentran los equipos de amarre y fondeo.
- Bajo cubierta hay un espacio dispuesto para almacenar herramientas de cubierta.

2.1 Mamparo de colisión.

La zona de proa está limitada por un mamparo transversal estanco que va desde el fondo hasta la cubierta principal y de babor a estribor. Este mamparo se llama mamparo de colisión, cuya posición viene regulada por el DNV (pt3 Ch1 Sec3 A400).

En el Anexo I Capítulo 3 Regla 12A del convenio MARPOL define la eslora L o eslora de reglamento como la eslora mayor entre:

- 96% de la eslora total medida en una flotación cuya distancia a la cara superior de la quilla sea igual al 85% del puntal mínimo de trazado.

$$L(85\%D) = 0,96 \cdot 278,3 = 276,17 \text{ m}$$

- Eslora medida en la flotación anterior desde la cara proel de la roda hasta el eje de la mecha del timón.

$$L(85\%D)_{RODA-MECHA} = 274,43 \text{ m}$$

Por tanto la eslora de reglamento será 276,17 metros.

La distancia a proa de la Perpendicular de Proa desde la que se medirá la ubicación del mamparo de colisión se especifica en DNV Pt3 Ch1 Sec32 A400, teniendo en cuenta que el buque tiene bulbo de proa, la distancia será la menor de las tres siguientes:

- La protuberancia del bulbo es 8,4 metros, y la mitad de esta distancia es 4,2 metros.
- El 1,5% de la eslora antes calculada → 4,142 metros.

- 3 metros.

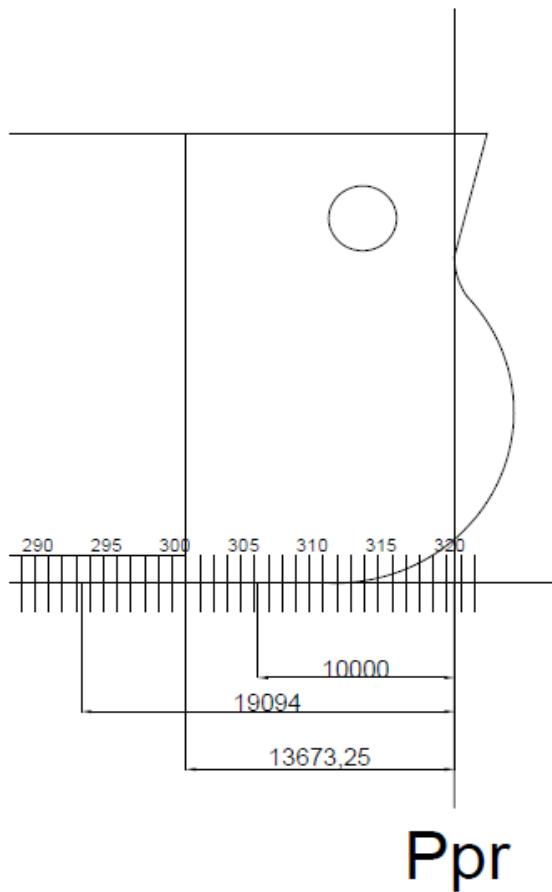

De estos tres valores escojo el menor: 3 metros.

El mamparo deberá estar a una distancia máxima y mínima de estos 3 m a proa de la Perpendicular de Proa y se calcula de la siguiente forma:

- *Distancia mínima: $(5\% \cdot L) - 3 = 10,809$ metros a popa de la Ppr ó 10 metros.*
- *Distancia máxima: $(8\% \cdot L) - 3 = 19,094$ metros a popa de la Ppr.*

Por tanto la distancia del pique de proa oscilará entre los 10 metros mínimos y los 19,094 metros máximos.

En definitiva, el mamparo de colisión lo decido situar a 260 metros de la Perpendicular de Popa, en la cuaderna 292 como se ve a continuación en un croquis donde se sitúa dicho mamparo:

3 ZONA DE POPA.

El pique de popa es la zona del mamparo más a popa del buque. Este mamparo encerrará el local del servomotor y tanques de lastre en un compartimento estanco.

El mamparo del pique de popa es obligatorio por la sociedad de clasificación DNV Pt3 Ch1 Sec3 A301, pero su ubicación exacta no se especifica.

Por lo que teniendo en cuenta el espaciado de cuadernas (750 mm) se ha decidido colocarlo a 6 metros de la Perpendicular de Popa.

4 ZONA DE CARGA.

La zona de carga, es la zona donde el buque va a alojar la carga que debe transportar.

El volumen útil de esta zona es uno de los parámetros críticos en el diseño de esta clase de buques, puesto que el buque debe ser capaz de transportar el volumen de carga que ha sido impuesto en la especificación.

Los parámetros y dimensiones principales de esta zona tan importante están regulados tanto por el convenio MARPOL como por las normas de la sociedad de clasificación coincidiendo ambas normativas en los aspectos comunes que regulan.

Esta zona se extiende desde el mamparo de proa de la cámara de máquinas hasta el mamparo de colisión y debe estar provista de doble casco y de doble fondo en toda su longitud.

1.3. Doble fondo.

La altura de doble fondo se define en el convenio MARPOL Anexo I Ch3 Regla 12A 6, cuya distancia mínima es la mínima de:

- $h_{df} = \frac{B}{15} = \frac{45,3}{15} = 3,02\text{ m.}$
- $h_{df} = 2\text{ m.}$

Con lo que la altura mínima de doble fondo será de 2 metros, y finalmente se establece una altura para el doble fondo de 2,5 metros.

1.4. Doble casco.

En cuanto a la anchura de doble casco el convenio MARPOL establece un requisito para la anchura en Anexo I Ch3 Regla 12A 8 que es el siguiente:

$$w_{dc} = 0,5 + \frac{DWT}{20000} = 0,5 + \frac{148000}{20000} = 7,9\text{ m}$$

$$w_{dc} = 2\text{ m}$$

La anchura mínima para el doble casco será de 2 metros, con lo que la anchura final del doble casco será de 2,5 metros.

Los espacios que quedan entre los tanques de carga y el costado del buque y doble fondo se usarán como tanques de lastre. MARPOL especifica en el Anexo I Ch4 Regla 18 la obligación de que todos los petroleros de crudo con peso muerto superior a 20000 toneladas, entregados después del 1 de Junio de 1982, deberán ir provistos de lastre separado, cuya capacidad mínima será tal que en todas las condiciones de lastre se cumpla que:

- Permite al buque navegar en condiciones de lastre sin necesidad de introducir agua de lastre en los tanques de carga.
- El lastre adicional del punto anterior solo se podrá cargar en tanques de carga lavados según la Regla 35 del Anexo I de MARPOL.
- El calado de trazado de la cuaderna maestra nunca será inferior a:

$$T_m = 2 + (0,02 \cdot L)$$

- Los calados en las Perpendiculares de Popa y de Proa corresponderán a los determinados por el calado en el centro del buque (T_m), con un asiento apopante no superior a:
- $$0,0155 \cdot L$$
- El calado en popa ha de garantizar siempre la inmersión total de la hélice.

1.5. Tanques de carga.

En el Anexo I Ch4 Regla 26 del convenio MARPOL la eslora máxima no será superior a:

$$L_{max} = \left(0,25 \cdot \frac{b_i}{B} + 0,15 \right) \cdot L$$

Donde B es la manga del buque y b_i es la distancia entre el costado del buque y el mamparo longitudinal exterior del tanque de carga, medida perpendicularmente al plano de crujía, que en este caso coincide con la anchura del doble casco de 2,5 m.

$$L_{max} = 45,236 \text{ m}$$

Las eslora de la cántara sin tener en cuenta los dos tanques slops situados a popa de ésta es de 204 metros, los tanques de carga son 6 por tanto cada uno tiene una eslora de 34 metros, con lo que cumple con el criterio anterior.

4.1 Tanques Slop.

Según MARPOL en Anexo I Ch4 Regla 29, la capacidad de los tanques de decantación o Slops será del 2% cuando existan tanques de lastre separado o tanques delicados a lastre limpio de conformidad con lo dispuesto a en la Regla 18

del Anexo I, o si se ha instalado un sistema de limpieza de los tanques de carga que utilice el lavado con crudos de conformidad con lo dispuesto en la Regla 33 del presente Anexo, los petroleros de peso muerto igual o superior a 70000 toneladas llevarán por lo menos 2 tanques de decantación.

Estos tanques han de tener la capacidad necesaria (la cual se calcula a continuación) para retener los vertidos generados por el lavado de tanques, residuos de aceite y residuos sucios de lastre.

Dicha capacidad de estos tanques no debe ser menor al 3% de la capacidad de carga, y como mis tanques de lastre van separados se hace excepción y serán del orden del 1,5% de la carga.

Están situados a popa del primer tanque de carga y para su dimensionamiento se necesitan definir los consumibles, tripulación y pertrechos. La RPA especifica que la tripulación es de 30 personas:

- Consumibles: víveres que consume la tripulación en el desarrollo de la vida a bordo, se consideran 4 kg por tripulante, autonomía de 42 días.
- Tripulación: se incluyen tripulantes, respetos, cargos y efectos; se consideran 125 kg por tripulante.
- Pertrechos: según el libro “El proyecto básico del buque mercante” se debe estimar un peso de entre 10-100 toneladas; se considerarán 70 toneladas.
- Respetos: hélice, amarres, estachas, maquinaria de repuesto...Se hace una estimación de 110 toneladas.

		Peso (t)
Consumibles	Víveres	5,04
Pesos fijos	Tripulación	3,75
	Pertrechos	70
	Respetos	110
		188,79

Si el volumen de carga transportada es el siguiente:

$$V_{carga} = \frac{TPM - Consumos - 188,79}{\rho}$$

$$V_{carga} = \frac{148000 - 3869 - 188,79}{\rho} = 167375 \text{ t}$$

Donde:

- ρ es la densidad de la carga, en este caso petróleo crudo de densidad relativa 0,86.

- Consumos= HFO, MDO, Aceite, agua técnica y dulce, aguas grises y aguas negras,lodos = 3869 t.

El volumen mínimo que deberán tener los tanques Slop será de:

$$V_{\min \text{slop}} = 0,015 * V_{\text{carga}} = 2511 \text{ m}^3$$

En este buque hay dos tanques Slop por tanto cada uno transportará como mínimo:

$$V_{\min \text{slop}} = 1255 \text{ m}^3$$

Por tanto las dimensiones finales de los tanques quedan:

TANQUES SLOPS	
Puntal tanque (m)	21,5
Manga Tanque (m)	21,5
Eslora Tanque (m)	10

5 ZONA DE MÁQUINAS.

La cámara de máquinas se sitúa a popa como es lo normal en este tipo de buques y así está impuesto en la especificación.

En la zona de cámara de máquinas se sitúan tanques de almacén y uso diario de Fuel-Oil, por tanto hay q aplicar el convenio MARPOL 73/78 para calcular la distancia mínima a la que deben situarse dichos tanques de fondo y del costado de la cámara de máquinas.

La cámara de máquinas tendrá un doble fondo de 2,5 metros excepto la zona de la cama del motor principal que tiene una altura de 2,3 metros. Esta zona también lleva doble casco de 2,5 metros.

El doble fondo y doble casco de la cámara de máquinas se extenderá desde el mamparo del pique de popa hasta el mamparo de popa de los tanques slop.

El doble casco de la cámara de máquinas se empleará para albergar tanques de lastre (como se verá más adelante) y en el doble fondo llevará tanques de:

- Aceite de lubricación del Motor Principal (Estribor).
- Aceite de lubricación de los Motores Auxiliares (Babor).
- Aceite de lubricación para cilindros del Motor Principal (Estribor).
- Aceite de lubricación para cilindros de Motor Auxiliar (Babor).
- Tanque de retorno del aceite de lubricación del Motor Principal (Carter).
- Tanques de sentinelas (Babor y Estribor).
- Tanques de lodos.
- Tanques de reboses de HFO.
- Tanque de aguas grises.
- Tanques de agua técnica.

5.1 Cámara de máquinas.

Para definir la longitud de la cámara de máquinas se ha de tener en cuenta principalmente la eslora del buque pero también el tipo de motor y el número y tamaño de equipos auxiliares.

El libro “El proyecto básico del buque mercante” proporciona una fórmula para estimar la eslora de la cámara de máquinas para buques con motor de 2 tiempos directamente acoplado a hélice. Para petroleros la expresión es:

$$L_{CM} = 0,28 \cdot L^{0,67} + 0,48 \cdot MCO^{0,35} = 0,28 \cdot 273,5^{0,67} + 0,48 \cdot 19350^{0,35} = 28 \text{ metros}$$

La longitud de la cámara de máquinas será de 29 metros para hacerlo coincidir con las cuadernas. La cámara máquinas va desde la cuaderna 7 a la cuaderna 45.

6 CÁLCULOS DEL VOLUMEN Y CONSUMO DE LOS TANQUES.

6.1 Tanques de Lastre.

Los tanques de lastre, los cuales se llenan de agua de mar, tienen la función de facilitar la navegación del buque cuando éste no satisface los requerimientos de estabilidad y trimados, bien sea por falta de carga o por haber gastado los consumos.

Estos tanques se dispondrán en zonas del buque de doble fondo y doble casco, siendo estos tanques simétricos encontrándose divididos por crujía con el fin de limitar la superficie libre que se produce como consecuencia de su llenado.

El buque debe de disponer de suficiente lastre para que la hélice permanezca totalmente sumergida, el calado mínimo tiene que ser:

$$T_{min} = D_{hélice} + 10\%D_{hélice} = 8,3 + 0,1 \cdot 8,3 = 9,12 \text{ m}$$

$$P_{rosca} = 28876 \text{ t}$$

Para este calado mínimo, con Maxsurf calculo el valor del desplazamiento mínimo obteniendo el siguiente dato:

$$\Delta_{min} = Cb \cdot \rho \cdot L \cdot B \cdot T = 0,866 \cdot 1,025 \cdot 273,5 \cdot 45,3 \cdot 9,12 = 100408 \text{ t}$$

El peso de agua de lastre será:

$$W_{lastre} = \Delta_{min} - P_{rosca} = 67798 \text{ t}$$

Por tanto el volumen de agua de lastre es:

$$Volumen_{lastre} = \frac{67798}{1,025} = 66144,3 \text{ m}^3$$

6.2 Tanques HFO.

6.2.1 Consumo del Motor Principal.

Para el cálculo de los consumos del motor principal se tendrán en cuenta la autonomía del buque que son 16.000 millas y la velocidad del buque que son 15,8 nudos:

$$\text{Días de autonomía} = \frac{11000 \text{ millas}}{15,8 * 24} = 30 \text{ días}$$

Para una potencia de 24289 kW al 85%MCR el consumo específico del motor es de 166,4 g/kWh, con lo que el consumo específico por día será de:

$$\text{Consumo} = 166,4 \cdot 24h \cdot 24289 * 0,85 \cdot 10^{-6} = 85 \frac{t}{\text{día}}$$

La densidad de HFO es de 0,98 t/m³ con lo que el consumo es de:

$$\text{Consumo}_\text{día} = \frac{85 \text{ t/día}}{0,98 \text{ t/m}^3} = 87 \text{ m}^3/\text{día}$$

6.2.2 Consumo de Motores Auxiliares.

Según el buque base, el presente buque llevará 4 diésel-generadores auxiliares del modelo Wartsila 6L20, de los cuales 2 funcionan normalmente al 85% para generar la potencia eléctrica necesaria, mientras que el tercero de ellos es de respecto.

Wärtsilä Auxpac		875W6L20 / 60 Hz IMO Tier 2	
Fuel system (Note 3)			
Pressure before injection pumps (PT 101)	kPa	700±50	
Pressure before injection pumps, unifuel system	kPa	1000±50	
HFO viscosity before injection pumps	cSt	16...24	
HFO viscosity before injection pumps, unifuel system	cSt	12...24	
Max. HFO temperature before engine (TE 101)	°C	140	
MDF viscosity, min.	cSt	1.8	
Max. MDF temperature before engine (TE 101)	°C	45	
Fuel consumption at 100% load	g/kWh	192	
Fuel consumption at 85% load	g/kWh	193	
Fuel consumption at 75% load	g/kWh	194	
Fuel consumption at 50% load	g/kWh	203	
Clean leak fuel quantity, MDF at 100% load	kg/h	3,7	
Clean leak fuel quantity, HFO at 100% load	kg/h	0,7	

Según la especificación de Wartsila el consumo de los motores auxiliares es de 193 g/kWh.

6.2.3 Consumo Calderas.

Siguiendo el buque base (Eagle San Antonio), se necesitan 2 calderas para calentar la carga. Las calderas del buque base son:

Boilers

Number: 2 x auxiliary boiler
1

Type: Mission OL3500, Mission OC2000/1600

Make: Aalborg

Output, each boiler: 35tonnes/h x 1.6MPa,
2tonnes/h x 0.6MPa for oil fired side,
1.6tonnes/h x 0.6MPa for exhaust side

En mi caso Las calderas son de la marca Mitsubishi del tipo MAC-35B y el consumo lo marca la especificación del fabricante:

Standard Specification															
MAC - **B Ex) 40t/h boiler → MAC-40B															
Type	M/MC	20B	25B	30B	35B	40B	45B	50B	55B	60B	70B	80B	90B	100B	110B

★ Design/Working Press is changeable according to request

 MITSUBISHI
HEAVY INDUSTRIES, LTD.

$$\text{Consumo}_{\text{caldera}} = 2,716 \text{ kg/h}$$

6.2.4 Consumos de Heavy Fuel-Oil.

- 1) El consumo diario de HFO necesario para el Motor Principal se calcula como:

$$V_{HFO} = \frac{P_{\text{funcionamiento}} \cdot Ce \cdot \text{Autonomía}}{\rho_{\text{fuel-oil}}} \cdot 10^{-6} = \frac{24289 \cdot 166,4 \cdot 1013h}{0,98} \\ = 3654 \text{ m}^3$$

$$V_{\text{uso diario HFO}} = \frac{P_{\text{funcionamiento}} \cdot Ce \cdot 24h}{\rho_{\text{fuel-oil}}} \cdot 10^{-6} = 87 \text{ m}^3$$

$$V_{\text{decantación HFO}} = \frac{P_{\text{funcionamiento}} \cdot Ce \cdot 36h}{\rho_{\text{fuel-oil}}} \cdot 10^{-6} = 130 \text{ m}^3$$

- 2) En cuanto al consumo de HFO por el motor auxiliar, uso datos de buque base y un 10% de la potencia del Motor Principal:

$$V_{HFO} = \frac{P_{funcionamiento} \cdot Ce \cdot Autonomía}{\rho_{fuel-oil}} = \frac{24289(10\%) \cdot 193 * 1000h}{0,98} \cdot 10^{-6} = 492 m^3$$

$$V_{uso\ diario\ HFO} = \frac{P_{funcionamiento} \cdot Ce \cdot 24h}{\rho_{fuel-oil}} \cdot 10^{-6} = 12 m^3$$

$$V_{decantación\ HFO} = \frac{P_{funcionamiento} \cdot Ce \cdot 36h}{\rho_{fuel-oil}} \cdot 10^{-6} = 18 m^3$$

3) Para el consumo de HFO de las calderas empleo su potencia de funcionamiento, el consumo antes indicado por el fabricante (Mitsubishi) y las horas de funcionamiento será de unas horas antes de la llegada a puerto, en mi caso serán 48 horas:

$$V_{HFO} = \frac{P_{funcionamiento} \cdot Ce \cdot h}{\rho_{fuel-oil}} \cdot 10^{-3} = \frac{900 \cdot 2,716 \cdot 48h}{0,98} \cdot 10^{-3} = 120 m^3$$

$$V_{uso\ diario\ HFO} = \frac{900 \cdot 2,716 \cdot 24h}{0,98} \cdot 10^{-3} = 60 m^3$$

$$V_{decantación\ HFO} = \frac{900 \cdot 2,716 \cdot 36h}{0,98} \cdot 10^{-3} = 90 m^3$$

El volumen total de los tanques de HFO es:

V _{HFO}	4266 m ³
V _{HFO USO DIARIO}	158 m ³
V _{HFO DECANTACIÓN}	237 m ³

Estos volúmenes se repartirán en:

- 4 Tanques almacén de HFO.
- 2 Tanques de uso diario HFO.
- 1 Tanques de decantación HFO.

6.3 Tanques MDO.

El Diésel Oil se utiliza como sistema alternativo de alimentación de combustible, tanto para el Motor Principal como para los auxiliares y calderas. La autonomía debe

ser suficiente para cubrir las necesidades durante tres días (72 HORAS), que es un tiempo suficiente para limpiar el sistema de abastecimiento de HFO.

El MDO necesario para el Motor Principal se divide en dos tanques, uno de uso diario y otro de almacén.

- 1) Para calcular el volumen del tanque de MDO para el Motor Principal:

$$V_{MDO} = \frac{P_{funcionamiento} \cdot Ce \cdot 72h}{\rho_{fuel-oil}} \cdot 10^{-6} = \frac{24289 \cdot 166,4 * 72h}{0,98} = 305,6 m^3$$

$$V_{uso\ diario\ MDO} = \frac{P_{funcionamiento} \cdot Ce \cdot 24h}{\rho_{fuel-oil}} \cdot 10^{-6} = 102 m^3$$

- 2) En cuanto a los auxiliares utilizo los datos del buque base y un 10% de la potencia:

$$V_{MDO} = \frac{P_{funcionamiento} \cdot Ce \cdot 72h}{\rho_{fuel-oil}} \cdot 10^{-6} = \frac{24289(10\%) \cdot 193 * 72h}{0,98} = 35,4 m^3$$

$$V_{uso\ diario\ MDO} = \frac{P_{funcionamiento}(10\%) \cdot Ce \cdot 24h}{\rho_{fuel-oil}} \cdot 10^{-6} = 11,8 m^3$$

- 3) Para el volumen de MDO de las calderas empleo datos del buque base:

$$V_{MDO} = \frac{P_{funcionamiento} \cdot Ce \cdot 72h}{\rho_{fuel-oil}} \cdot 10^{-3} = \frac{900 \cdot 2,716 * 72h}{0,98} = 179,6 m^3$$

$$V_{uso\ diario\ MDO} = \frac{P_{funcionamiento}(10\%) \cdot Ce \cdot 24h}{\rho_{fuel-oil}} \cdot 10^{-3} = 60 m^3$$

Los motores auxiliares y las calderas funcionan las dos de forma continua, por tanto el volumen del diésel en estos casos será el doble.

El volumen de MDO queda:

V _{MDO}	735,7 m ³
V _{MDO USO DIARIO}	245,2 m ³

6.4 Tanques de Aceite.

Se pueden utilizar distintos tipos de aceite: lubricación de motores, hidráulico y térmico.

Las cantidades a transportar son recomendadas por los suministradores de los equipos.

El aceite que se utiliza para la lubricación de los motores se supone el 5% del peso de combustible:

1) Tanque almacén Aceite para Motor Principal:

$$V_{aceite\ MP} = (V_{HFO} + V_{MDO}) \cdot 0,05 = 198\ m^3$$

2) Tanque almacén Aceite para Motores Auxiliares:

$$V_{aceite\ MA} = (V_{HFO} + V_{MDO}) \cdot 0,05 = 26,4\ m^3$$

El volumen del tanque de aceite será de:

$$V_{aceite} = 224,4\ m^3$$

6.4.1 Tanque almacén aceite de cilindros:

Para calcular el consumo de aceite de cilindros del motor principal usaré la siguiente fórmula apoyándome del buque base para datos del calor específico.

$$V_{aceite\ lubric.\ cilindros} = \frac{P_{funcionamiento}(10\%) \cdot Ce \cdot 1000h}{\rho_{aceite}} \cdot 10^{-6} = 17,2\ m^3$$

El tanque se diseña para un máximo de 5 cambios de aceite, quedando un volumen final de:

$$V_{aceite\ lubric.\ cilindros} = 86\ m^3$$

6.4.2 Tanque de aceite de retorno (Carter del Motor Principal).

El motor de este buque es un motor lento cuya lubricación se realiza mediante carter seco, por lo que habrá un tanque debajo del motor al que se devuelva el aceite después de lubricar determinadas partes del motor.

Para el volumen de este tanque realizo una estimación con el tanque del buque base:

$$V_{aceite\ de\ retorno} = 25\ m^3$$

6.5 Tanque de Aguas.

6.5.1 Tanque de Agua Dulce.

Para los cálculos de este tanque se tendrá en cuenta:

- Días de autonomía = $\frac{11000\ millas}{15,8*24} = 30\ días$
- Número de tripulantes: 30

Agua Potable	Nº Tripulantes	Nº Días	I/tripulante	Consumo (l)
Lavabos	30	30	15	18900
Cocina	30	30	5	6300
Limpieza	30	30	20	25200
				50400

El volumen de los tanques de Agua Dulce será:

$$V_{agua\ dulce} = 50,4\ m^3$$

Como llevamos dos tanques serán 25,2 por tanque.

6.5.2 Tanque de Agua sanitaria.

Para realizar el cálculo del peso de agua potable se ha consultado la norma UNE-EN ISO 15748-2 2003, en la que se especifica según el tipo de buque el número de litros de agua potable consumidos por persona y por día.

Tabla A.1
Valores guía para el consumo de agua potable en litros por persona/cama y día

Tipo de buque		Grupo de personas embarcado	Consumo de agua cuando esté equipado con	
			sistema de aseos de gravedad	sistema de aseos de vacío
Buque de alta mar	Carguero	Tripulante/cama	220 l	175 l
	Buque de pasaje	Pasajero/cama	270 l	225 l
	Crucero de lujo	Pasajero/cama	—	275 l
	Trasbordador con cabinas	Pasajero/cama	205 l ^a	160 l ^a
		Pasajero sin cama	100 l	55 l
	Trasbordador sin cabinas	Pasajero sin cama	150 l	105 l
		Tripulante sin cama	100 l	55 l

Teniendo en cuenta que el buque proyecto se considera un buque de carga, y que este está equipado con sistema de aseos de vacío, el peso de agua necesario será el siguiente:

$$\text{Días de autonomía} = \frac{11000 \text{ millas}}{15,8 * 24} = 30 \text{ días}$$

$$V_{\text{sanitaria}} = 30 \text{ días} \cdot 175 \frac{\text{litros} \cdot \text{persona}}{\text{día}} \cdot \frac{1 \text{ kg}}{1 \text{ l}} \cdot \frac{1 \text{ t}}{10^3 \text{ kg}} = 7,35 \text{ t}$$

$$V_{\text{sanitaria}} = \frac{7,35 \cdot 30 \text{ pers.}}{1,000 \text{ t/m}^3} = 220,5 \text{ m}^3$$

6.5.3 Tanque Aguas grises y Aguas negras.

Para los tanques de aguas grises y negras se estima una autonomía de tanque de 3 días, correspondiente a la estancia en puerto.

Para el cálculo de la capacidad de los tanques de almacén de aguas negras y grises se recurre a la norma UNE-EN ISO 15749-1 2005.

- AGUAS DE DESECHO: aguas no corrientes que han sufrido cambios debido a su uso, como por ejemplo aguas negras (aguas contaminadas), aguas de lluvia, aguas de mar, aguas de condensación que han alcanzado las líneas de achiique. Con este tipo de aguas se hace una distinción, entre aguas grises y aguas negras.

Tabla 1
Clasificación de las aguas de desecho

Origen		Tipo de aguas de desecho
Achiiques sanitarios		
Aseos generales	Bidés, retretes, urinarios	aguas negras
	Desagües ^a	aguas negras o grises
Zonas hospitalarias	Todas las unidades de achiique (incluyendo las instalaciones de lavabos y baños, así aguas negras como las descargas de los desagües)	aguas negras
Lavabos y cuartos de baño	Bañeras, duchas, lavabos, lavamanos, desagües ^a	aguas grises o negras
Cocinas, despensas	Fregaderos, lavaderos, desagües, electrodomésticos	aguas grises
Otros espacios	Centrales de aire acondicionado (si hay desagües de agua de condensación sobre cubierta), lavanderías, pasillos, espacios para provisiones refrigeradas, piscinas, jacuzzis	aguas grises

^a Las aguas de desecho procedentes de desagües inmediatamente adyacentes a retretes o urinarios se clasifican como aguas negras (véase el apartado 3.3).

- AGUAS GRISES: son aguas de desecho que deben evacuarse, con excepción de las aguas negras
- AGUAS NEGRAS: aguas de desechos procedentes de retretes, urinarios y bidés, incluyendo aditivos; de zonas médicas (enfermería, hospital, farmacia, etc.) y de lavabos, bañeras y descargas de agua de estas áreas; de espacios en los que habiten animales vivos y de otros tipos de aguas de desecho, si se mezclan con las aguas contaminadas que se han mencionado.

Tabla 2
Cantidad mínima de agua de desecho

Tipo de buque	Cantidad mínima de agua de desecho por persona y día en litros			
	Planta sin vacío		Planta con vacío	
	Aguas negras	Aguas negras y grises	Aguas negras	Aguas negras y grises
Buques de pasaje	70	230	25	185
Buques de alta mar exceptuando los de pasaje	70	180	25	135

Los buques costeros pueden conservar los valores recomendados por las autoridades responsables.
NOTA – Estos valores son los recomendados. Hay que considerar las posibles variaciones debidas a los reglamentos nacionales o a las recomendaciones de las sociedades de clasificación.

1) Tanque de Aguas negras.

$$V_{aguas\ negras} = 30\ tripulantes \cdot 30\ días \cdot 25 \frac{l}{trip} = 31500\ litros$$

2) Tanque de Aguas negras y grises.

$$V_{aguas\ negras\ y\ grises} = 30\ tripulantes \cdot 30\ días \cdot 135 \frac{l}{trip} = 170100\ litros$$

$V_{aguas\ negras}$	$31,5\ m^3$
$V_{aguas\ negras\ y\ grises}$	$170,1\ m^3$

6.5.4 Tanque de Agua Técnica.

El agua técnica se utiliza para reponer las pérdidas producidas en el circuito de vapor. El valor de la producción total de vapor lo desconozco por lo que el volumen de este tanque será una estimación del volumen del tanque del buque base:

$$V_{agua\ técnica} = 50m^3$$

Como hay dos tanques el volumen se reparte:

$$V_{agua\ técnica} = 25\ m^3$$

Estos tanques van situados en el doble fondo de la cámara de máquinas.

6.6 Tanque de Rebozes HFO.

Este tanque recoge los derrames de los tanques de HFO. El volumen lo calculo con la siguiente fórmula:

$$V_{rebozes\ HFO} = \frac{Potencia \cdot C_e \cdot 5h}{\rho_{fuel-oil}} \cdot 10^{-6} = 16,4\ m^3$$

6.7 Tanque de Lodos.

Para determinar la capacidad del tanque de fangos se siguen las distintas reglas del Convenio MARPOL, Anexo I Reglas para prevenir la contaminación por

hidrocarburos, en concreto la regla 12 de este anexo (tanques para residuos de hidrocarburo (Fangos)), en la que dice:

Todos los buques de arqueo igual o superior a 400 estarán provistos de un tanque o tanques con capacidad adecuada, según el tipo de maquinaria y la duración del viaje, para recibir los residuos de hidrocarburos (fangos) que no puedan tratarse de otra forma con arreglo a las disposiciones del presente anexo

Y en la interpretación de dicha regla, Capacidad de los tanques de fangos se da una fórmula para calcular el volumen de los tanques de fangos respecto a los buques que no llevan agua de lastre en los tanques de combustible líquido:

$$V_1 = k_1 \cdot C \cdot D \text{ (m}^3\text{)}$$

Donde:

- K_1 vale 0,01 para los buques en los que se purifique el fueloil pesado destinado a la maquina principal, o 0,005 para los buques en los que se utilice dieseloil o fueloil pesado que no haya de ser purificado antes de su uso
- C=consumo diario de fueloil (toneladas).
- D=duración máxima del viaje entre los puertos en los que puede descarase fangos en tierra (días). A falta de datos precisos se utilizará la cifra de 30 días.

Para el presente buque:

- $K_1 = 0,01$
- $C = \frac{166,4 \text{ g}}{\text{kWh}} \cdot 24 \text{ h} \cdot 24289 \text{ kW} \cdot 10^{-6}$
- $D = \frac{11000 \text{ millas}}{15,8 \cdot 24} = 30 \text{ días}$

$$V_1 = 32 \text{ m}^3$$

Al final del documento se adjunta el plano de tanques en el Anexo I.

7 CÁLCULO HIDROSTÁTICAS.

1.6. Comprobación del peso muerto.

El Peso en Rosca del buque es de 32610 t, y el programa Maxsurf me da el valor del desplazamiento Δ que vale 195606 t:

	Measurement	Value	Units
1	Displacement	195606	t
2	Volume (displaced)	190834,731	m^3
3	Draft Amidships	17,700	m
4	Immersed depth	17,700	m
5	WL Length	277,195	m
6	Beam max extents o	45,300	m
7	Wetted Area	19990,569	m^2
8	Max sect. area	796,238	m^2
9	Waterpl. Area	11598,960	m^2
10	Prismatic coeff. (Cp)	0,877	
11	Block coeff. (Cb)	0,870	
12	Midship Sect. area c	0,993	
13	Waterpl. area coeff.	0,936	
14	LCB length	141,489	from z
15	LCF length	134,691	from z
16	LCB %	51,733	from z
17	LCF %	49,247	from z
18	KB	9,133	m
19	KG fluid	0,000	m
20	BMt	9,683	m
21	BML	338,277	m
22	GMT corrected	18,816	m
23	GML	347,410	m
24	KMt	18,816	m
25	KML	347,410	m
26	Immersion (TPc)	118,889	tonne/c
27	MTc	2484,658	tonne.
28	RM at 1deg = GMt.Di	64234,668	tonne.

Sabiendo que:

$$TPM = \Delta - PR = 195606 - 32610 = 162996 \text{ t}$$

Con lo que cumple el requerimiento de 148.000 TPM con un margen del 3%

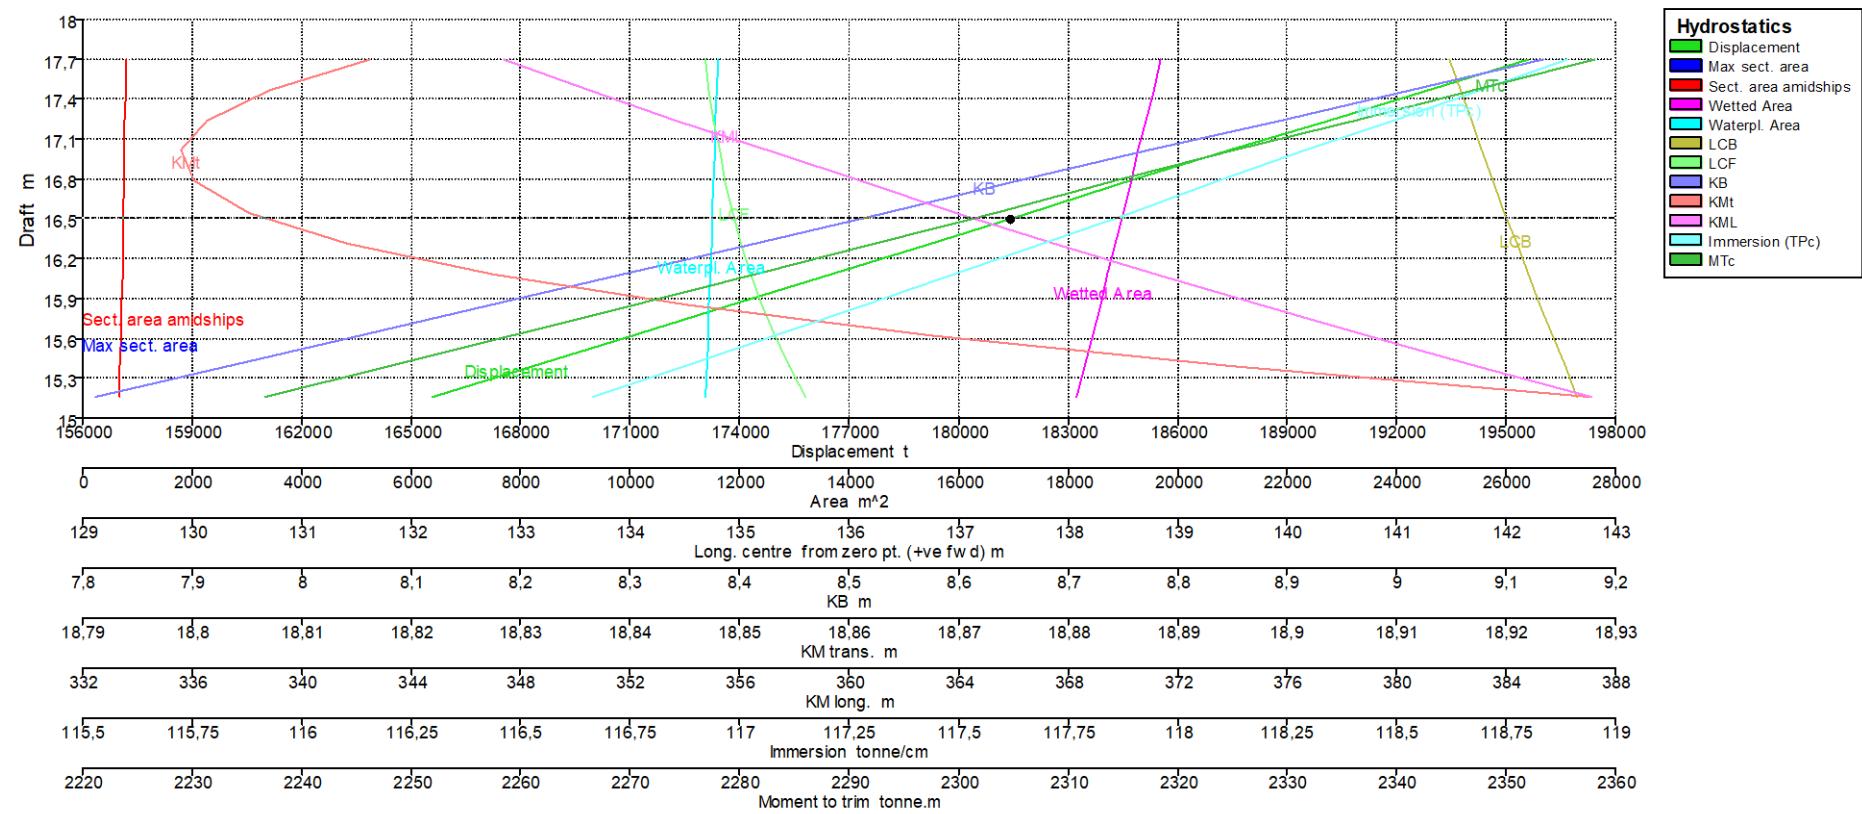

Para el cálculo de las hidrostáticas se emplea el programa Maxsurf Stability, mediante la herramienta “Updright Hydrostatics” para los siguientes trimados:

- Asiento por Proa: $t = -2,735$ m.
- Asiento cero: $t = 0$.
- Asiento por Popa: $t = +2,735$ m.

1.7. Hidrostáticas para Trimado Cero.

8 CURVAS KN'S (CARENAS INCLINADAS).

Las curvas de KN's se calculan mediante Maxsurf Stability con la herramienta "KN Values" para los trimados:

- Asiento por Proa: $t = -2,735$ m.
- Asiento cero: $t = 0$.
- Asiento por Popa: $t = +2,735$ m.

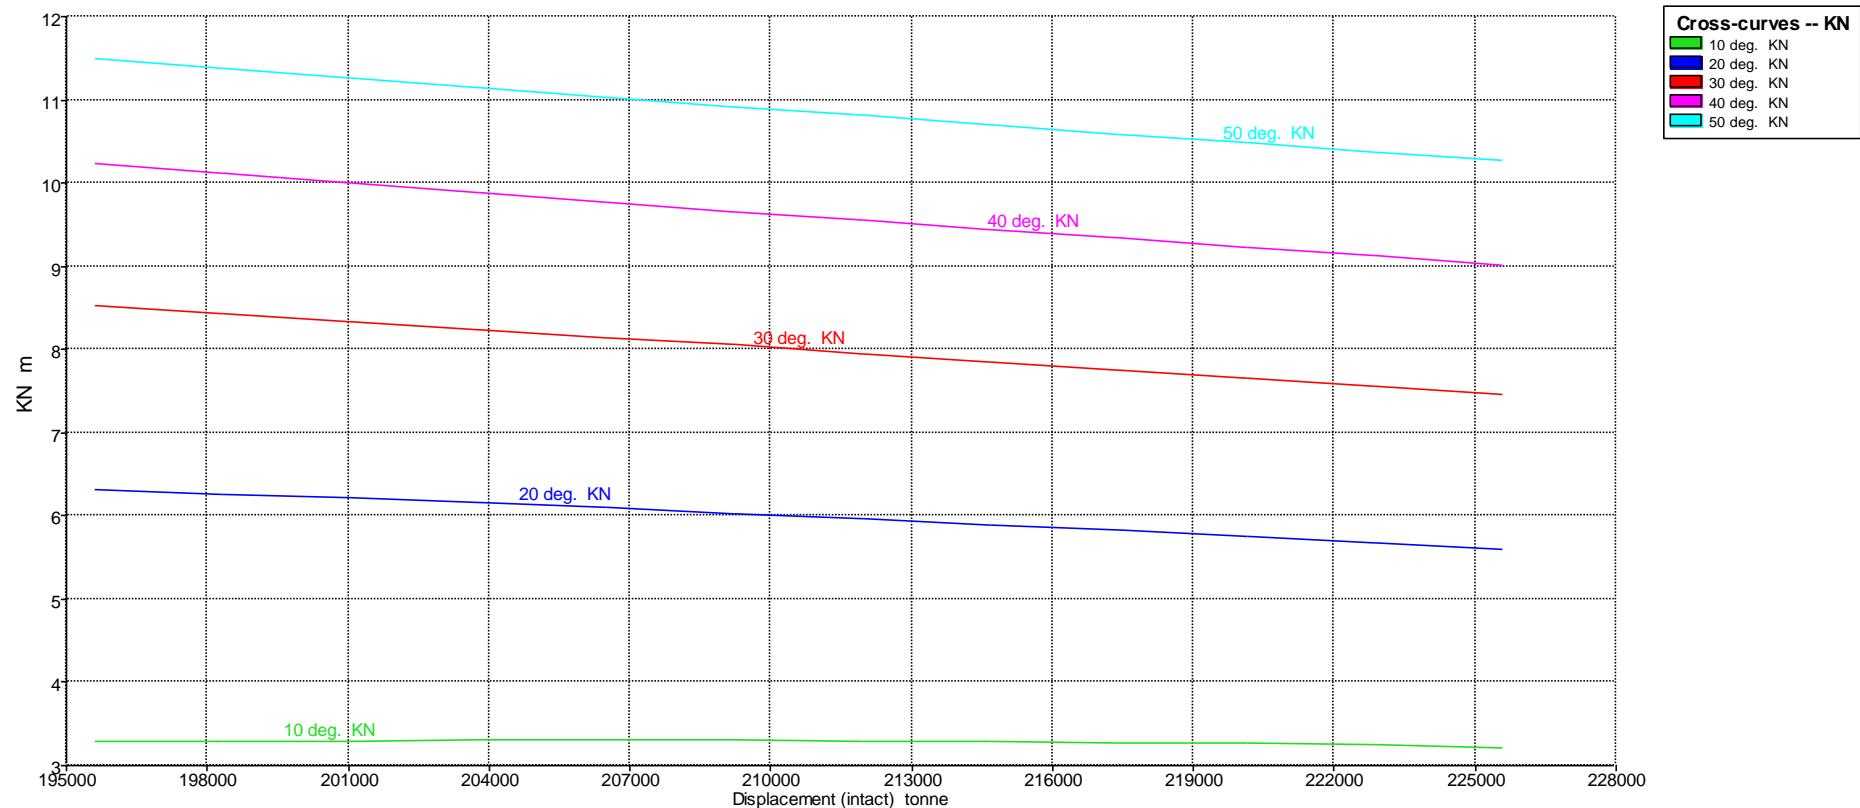

8.1 Curva KN's (Trimado 0).

2. DEFINICIÓN DE LA ZONA ESTANCA Y PUNTOS DE INUNDACIÓN PROGRESIVA (PIP).

Sobre la cubierta principal del buque se encuentran el guardacalor para los conductos de los gases de escape y una superestructura que consta de 4 cubiertas más el puente de mando.

Bajo la cubierta principal la disposición consta del propio casco del buque, donde se encuentran tanques de carga y lastre, cámara de máquinas y piques de Proa y Popa, para garantizar la estanqueidad de esta zona se dotará al buque de puertas y escotillas estancas.

Las aberturas del buque definidas como estancas a la entrada de agua son:

- Puertas laterales de entrada estancas a la habitación.
- Puertas laterales estancas de entrada a los locales del guardacalor.
- Puertas de entrada estancas a los almacenes de proa.

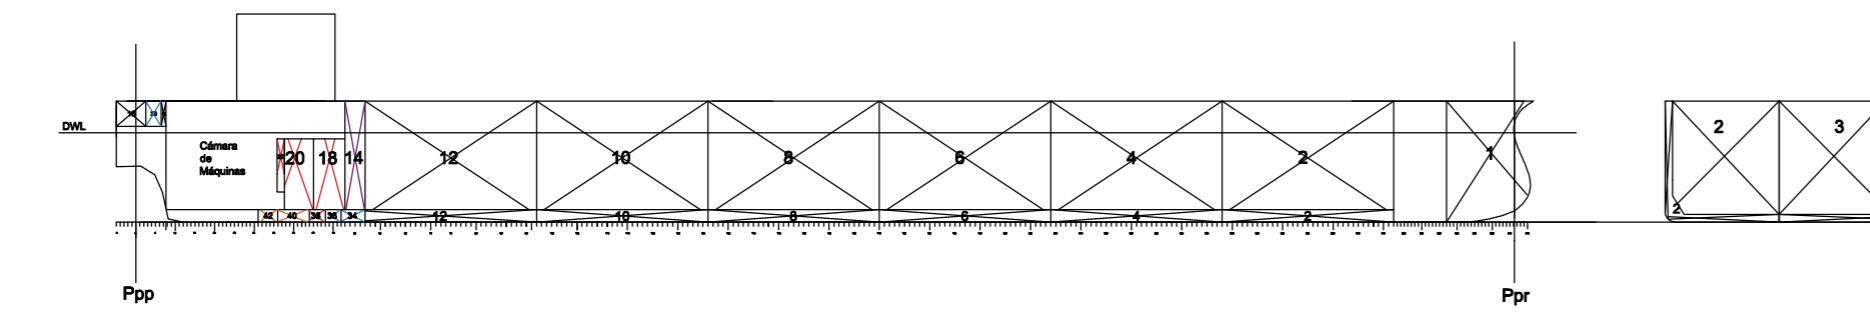

Los PIP son los puntos del buque por donde puede entrar el agua de forma progresiva, y lo más desfavorables son los que están cerca de la cubierta principal y más hacia uno de los costados.

Los PIP de este buque serán:

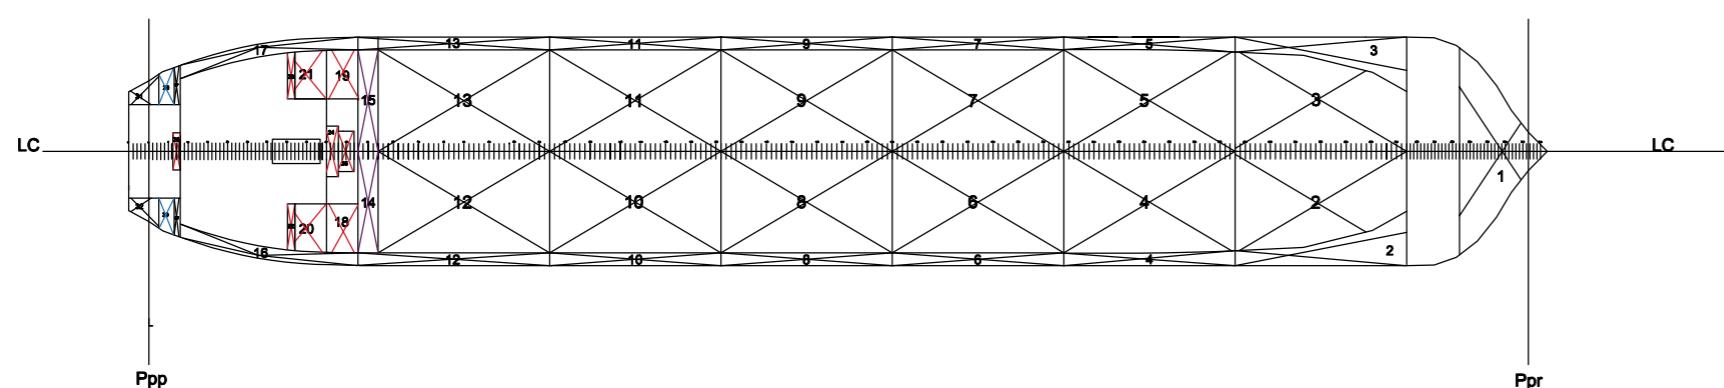

- Puertas laterales a la intemperie de entrada al puente de mando.
- Conductos de ventilación de la cámara de máquinas.
- Rebooses de los tanques de carga.

Los PIP se ven representados en el plano del buque en el Anexo I de este cuaderno.
