

LNG TANKER 160.000m³

NÚMERO 17-05

AUTORA: CARMEN SEOANE FERNÁNDEZ
TUTOR: VICENTE DÍAZ CASÁS

CUADERNO 4

CÁLCULOS DE ARQUITECTURA NAVAL

Escola Politécnica Superior
UNIVERSIDADE DA CORUÑA

GRADO EN INGENIERÍA NAVAL Y OCEÁNICA

TRABAJO FIN DE GRADO

CURSO 2.017-2018

PROYECTO NÚMERO 17/05

TIPO DE BUQUE: LNG carrier.

CLASIFICACIÓN, COTA Y REGLAMENTOS DE APLICACIÓN: Bureau Veritas, SOLAS, MARPOL, CIG.

CARACTERÍSTICAS DE LA CARGA: LNG con una capacidad de 160.000 m³.

VELOCIDAD Y AUTONOMÍA: 19.5 knots a velocidad de servicio, al 85% MCR + 15% MM y 5000 millas de autonomía.

SISTEMAS Y EQUIPOS DE CARGA / DESCARGA: bombas de carga y de vapor habituales en buques de este tipo.

PROPULSIÓN: dual-fuel diesel-electric (DFDE)

TRIPULACIÓN Y PASAJE: capacidad para 40 tripulantes en camarotes dobles e individuales.

OTROS EQUIPOS E INSTALACIONES: los habituales en este tipo de buques.

Ferrol, 18 Setiembre 2017

ALUMNA: D^a Carmen Seoane Fernández

1. INTRODUCCIÓN.

En este cuaderno se define la disposición de las zonas del buque así como la distribución de tanques para comprobar los aspectos relacionados con la estabilidad. Se recuerdan características principales del buque:

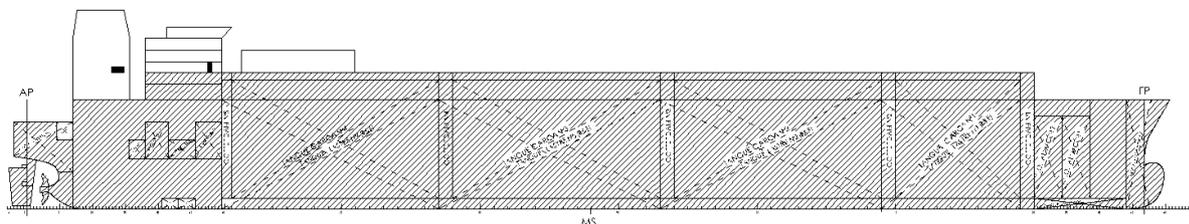

Lpp (m)	271,3
B (m)	45,4
D (m)	26,4
T (m)	12,3
Δ (t)	119484,5
LBD (m ³)	324.682,40
Cb	0,767
Cm	0,992
Cp	0,774
V (kn)	19,5

Tabla 1 Características principales

2. DEFINICIÓN DE ZONA ESTANCA.

Se define zona estanca como aquella zona que no dispone de aberturas o si las tuviera estarán protegidas con cierres estancos a la intemperie.

La zona estanca de el buque proyecto abarcará desde la línea base hasta la cubierta de francobordo, a 26,4 metros. Será zona estanca la parte superior de los tanques que sobresale de la cubierta de francobordo.

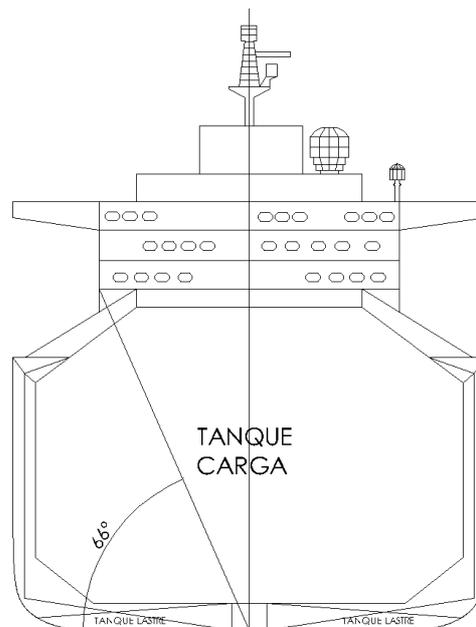

3. PUNTOS DE INUNDACIÓN PROGRESIVA.

Los puntos de inundación progresiva son aberturas no estancas a la intemperie que se sitúan por encima de la cubierta de francobordo. Son puntos que provocarán una inundación progresiva si están sumergidos. Podrá soportar sin filtrar agua una situación de inmersión transitoria como un golpe de mar pero no una situación de inmersión permanente. Limitarán el ángulo de inundación.

En este buque se considerará como puntos de inundación progresiva los accesos en la superestructura a la zona de habilitación así como la ventilación de la cámara de máquinas. Se considerará que están situados a:

PUNTOS INUNDACIÓN PROGRESIVA	Xg(m)	Yg(m)	Kg(m)
ACCESO HABILITACIÓN(B)	44,8	-14,4	33,0
ACCESO HABILITACIÓN(E)	44,8	14,4	33,0
VENTILACIÓN C.M. (B)	22,0	-13,0	35
VENTILACIÓN C.M. (E)	22,0	13,0	35

4. DISPOSICIÓN DEL COMPARTIMENTADO.

Para calcular los elementos del compartimentado, habrá que regirse por el Código Internacional de Gaseros, por la SSCC y por SOLAS. Este buque está catalogado como un buque 2G ya que está destinado al transporte de gas natural.

CLARA DE CUADERNAS

Para definir el espacio entre cuadernas y bulárcamas se tendrá en cuenta el Barcelona Knutsen ya que la sociedad de clasificación no hace referencia al espaciado de las mismas. Se adjunta la ficha de dicho buque en el anexo.

Zona de popa y cámara de máquinas: 800 mm

Zona de tanques: 3360 mm

Zona de proa: 800 mm

Cada dos claras, habrá una bulárcama.

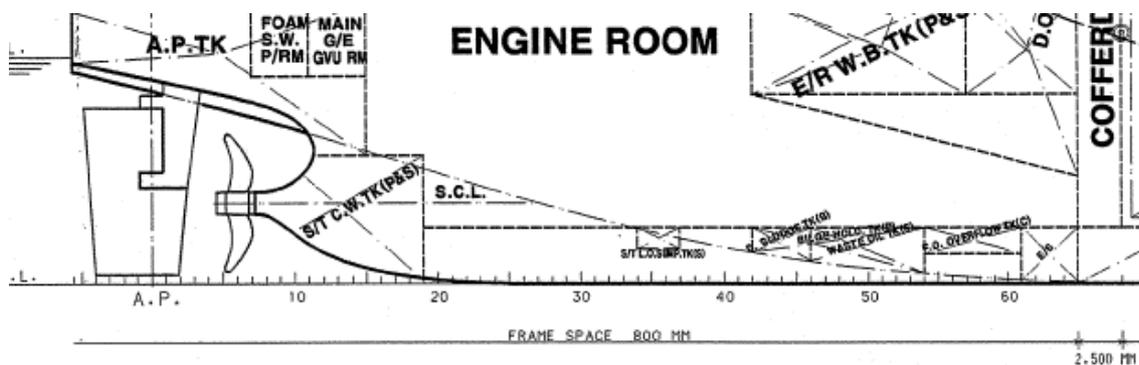

Ilustración 1 Espacio entre cuadernas en popa y cámara de máquinas

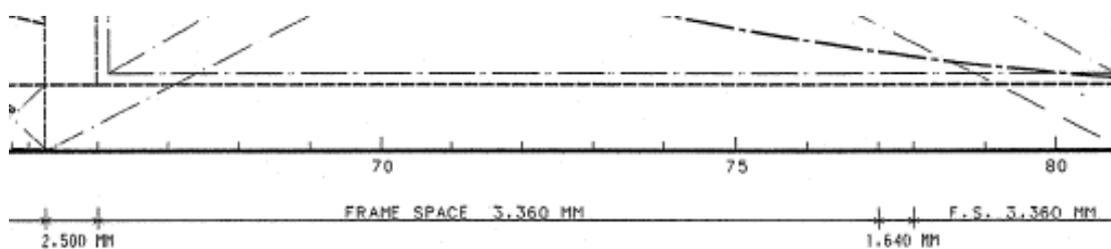

Ilustración 2 Espacio entre cuadernas en zona de tanques

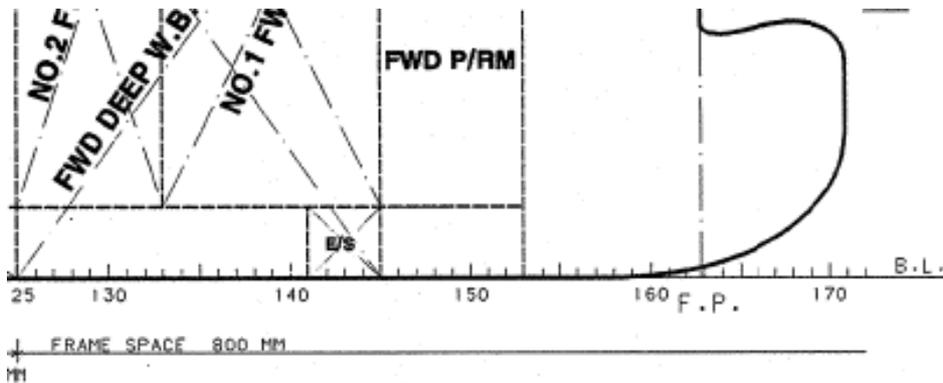

Ilustración 3 Espacio entre cuadernas en zona de proa

DOBLE CASCO

El código CIG: “Buques de tipos 2G/2PG y 3G: desde la línea de trazado de la chapa del forro del fondo, en el eje longitudinal, una distancia no menor que la extensión vertical de la avería especificada en 2.5.1.2.3; en ningún punto será de menos de 760 mm desde la chapa del forro. “

Tomando de referencia el buque Barcelona Knutsen se considerará un doble casco de 2,2 metros que se utilizará como tanques de lastre.

DOBLE FONDO

La sociedad de clasificación Bureau Veritas exige una altura mínima del doble fondo de 0,7 m: “La altura del doble fondo debe ser suficiente para asegurar el acceso a todas las partes y, en el camino de la viga central, debe ser no menos de 0,7m.

Tomando de referencia el buque Barcelona Knutsen se considerará un doble fondo de 2,6 metros. En la línea de crujía se instalará a lo largo de la eslora el pipe duct. Este conducto tendrá la altura del doble fondo y tendrá una manga de 3,4 metros y se utilizará para el paso de cables y tuberías necesarias así como para el acceso de la tripulación.

Para hacernos una idea de este valor tomando de referencia $h = \frac{B}{20} = 2,27 \text{ m}$ para buques de pasaje o de carga que no sean buques tanque (SOLAS).

PIQUE DE POPA

El reglamento no exige un valor, suele tomarse como referencia el 4% de la eslora para buques de grandes dimensiones. También se tendrá en cuenta la disposición del buque base. Estos datos son tomados desde la perpendicular de popa hacia proa:

$$4\%L_{pp} = 10,85 \text{ m}$$

Barcelona Knutsen 11,1 m.

Para este proyecto tomaremos por tanto un valor de 11,2 m coincidiendo así con la cuaderna 14.

PIQUE DE PROA

Para calcular el mamparo de colisión utilizaremos lo exigido por el SOLAS en el capítulo II:

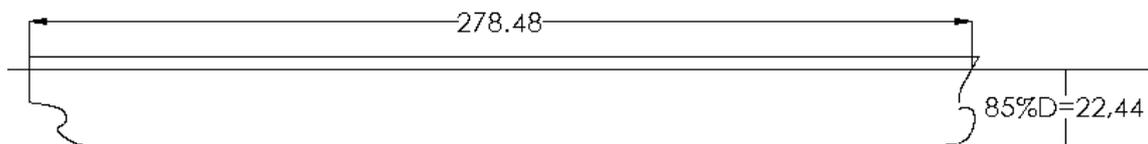

“Se instalará un mamparo de colisión que será estanco hasta la cubierta de cierre. Este mamparo estará situado a una distancia de la perpendicular de proa no inferior al 5% de L o a 10 m, si esta segunda magnitud es menor, y, salvo cuando la Administración permita otra cosa, dicha distancia no será superior al 8% de L. Cuando cualquier parte del buque que quede debajo de la flotación se prolongue por delante de la perpendicular de proa, como por ejemplo ocurre con una proa de bulbo, las distancias estipuladas en el párrafo 2 se medirán desde un punto situado:

- *A mitad de dicha prolongación.*
- *A una distancia igual al 1,5% de la parte de la eslora del buque que quede por delante de la perpendicular de proa.*
- *A una distancia de 3 m por delante de la perpendicular de proa.*

Tomándose de esas medidas la menor. “

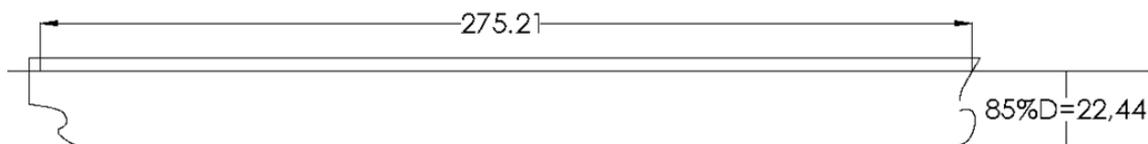

Para este cálculo se debe definir la eslora que se utilizará. Se tomará el valor máximo de:

96 % de la eslora total desde el extremo de la roda hasta el extremo del codaste en una flotación al 85 % del puntal mínimo de trazado:

$$96\% \text{ de } 278,48 = 267,34 \text{ m}$$

Eslora desde el extremo de la roda hasta el eje de la mecha del timón en la misma flotación:

$$L = 275,21 \text{ m}$$

Se escogerá el valor máximo, por tanto la eslora para los cálculos del mamparo de colisión será $L = 275,21 \text{ m}$.

Se recuerda que “Este mamparo estará situado a una distancia de la perpendicular de proa no inferior al 5% de L o a 10 m, si esta segunda magnitud es menor”. A partir de la eslora calculada se obtiene que:

$$5\% \text{ de } L = 13,76 \text{ m}$$

En este proyecto por tanto se escogerá 10 metros. Ahora se debe tener en cuenta el bulbo en proa para restar ese valor. Se considerará el menor de:

Mitad de dicha prolongación. 2,40 m

Distancia igual al 1,5% de la parte de la eslora del buque que quede por delante de la perpendicular de proa. 4,16 m

Distancia de 3 m por delante de la perpendicular de proa.

Se escogerá 2,40 m por ser el valor mínimo. Al valor calculado antes de 10 metros se tiene que restar este valor mínimo, por tanto, se obtiene:

$$10 - 2,40 = 7,60 \text{ metros}$$

Si a la eslora calculada se le resta este valor se obtiene la distancia mínima donde debe colocarse el mamparo de colisión.

$$DISTANCIA \text{ MÍN} = 267,60 \text{ m}$$

Según el reglamento no puede exceder del 8% de la eslora. A este valor se le restará el valor de 2,40 metros antes calculado.

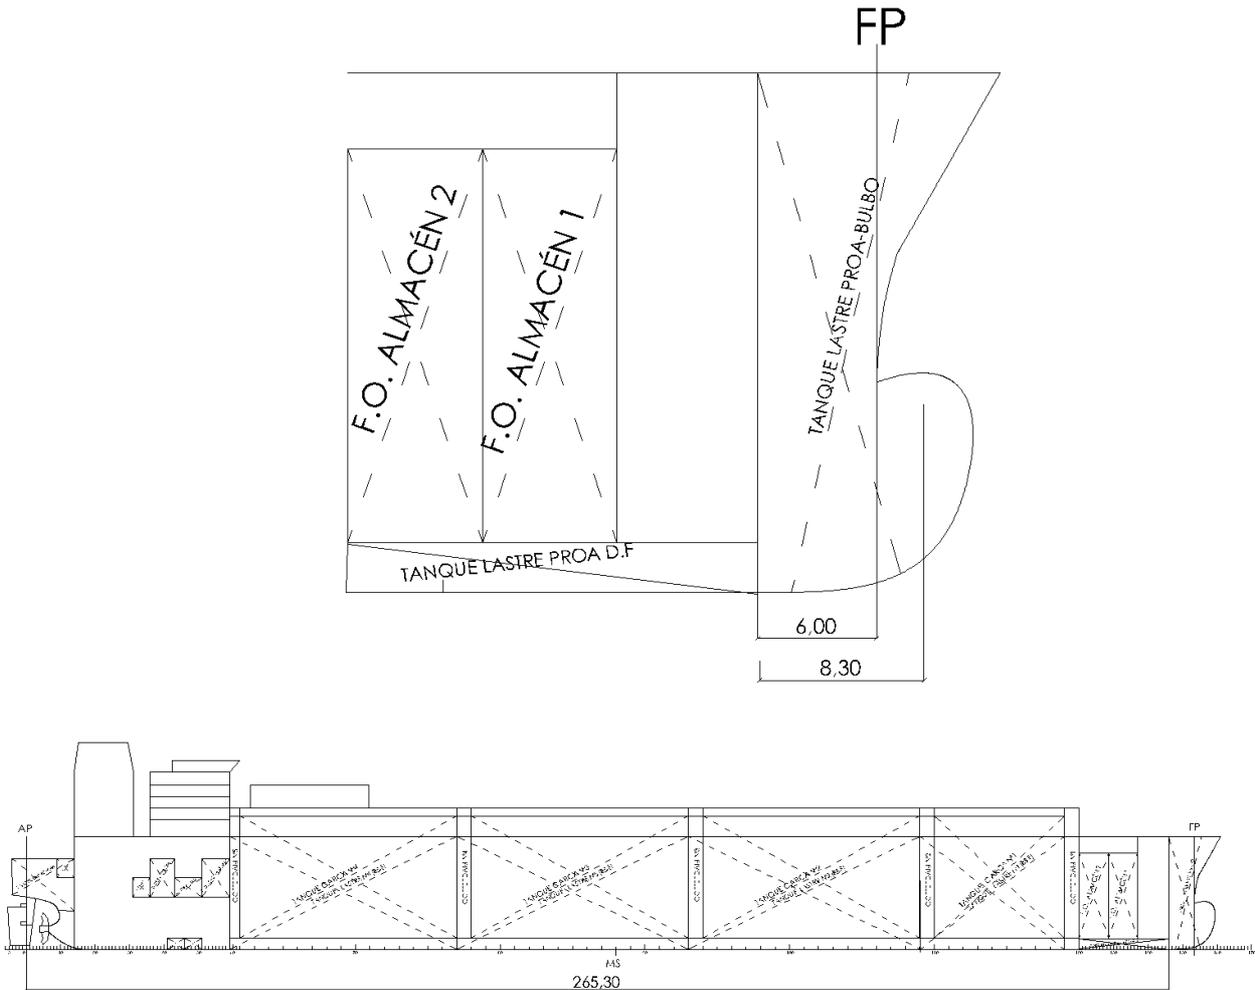

$$22,02 - 2,40 = 19,62 \text{ m}$$

Restando al valor de la eslora,

$$DISTANCIA \text{ MÁX} = 255,59 \text{ m}$$

Por tanto, el mamparo de colisión estará situado entre esos dos valores. En este proyecto se situará haciéndolo coincidir con una cuaderna:

$$PIQUE \text{ PROA} = \text{CUADERNA } 146 = 265,30 \text{ m}$$

LONGITUD CÁMARA DE MÁQUINAS

Para definir este valor, debemos basarnos en el buque base Barcelona Knutsen. La longitud en este buque es de 47,4 metros. La cámara de máquinas incluye espacios para bombas, tanques auxiliares y equipos del buque.

En este proyecto la longitud de la cámara de máquinas será 47,2 metros coincidiendo con la CUADERNA 59.

COFFERDAMS

Los espacios de bodega estarán separados de los espacios de máquinas y de calderas, de alojamiento y de servicio, puestos de control, cajas de cadenas, tanques de agua potable y de agua destinada a usos domésticos, y pañoles. Cada tanque de carga irá separado mediante un cofferdam, se menciona en este punto que estos cofferdams irán vacíos y no se utilizarán como tanques de lastre.

Se situarán cofferdams cerrando la cámara de máquinas y situados entre los tanques. Las medidas se han obtenido a partir del buque base. Se muestra una tabla para visualizar su posición:

COFFERDAM	LONGITUD (m)	POSICIÓN (m)	Nº CUADERNA
Nº5	2,40	47,20-49,60	59-62
Nº4	3,36	100,00-103,35	77-78
Nº3	3,36	153,75 -157,10	93-94
Nº2	3,36	207,65-210,90	109-110
Nº1	3,36	241,15-244,50	119-120

Se muestra un plano de la disposición del compartimentado en el anexo.

5. JUSTIFICACIÓN TANQUES Y CAPACIDADES.

En este apartado se calcularán los volúmenes mínimos de los consumos para la autonomía que requiere el buque.

La RPA obliga a tener de autonomía de 5.000 millas a una velocidad de servicio de 19,5 Kn, por tanto, el tiempo de navegación será de 11 días aproximadamente.

5.1. CAPACIDADES TANQUES DE FUEL OIL.

Este buque llevará instalados cuatro motores dual-fuel como motores generadores para la planta eléctrica. Se debe tener en cuenta la condición de funcionamiento de estos motores. Simultáneamente funcionarán tres motores.

El dimensionamiento de los tanques de combustible lo realizaremos teniendo en cuenta la situación de mayor consumo, es decir, cuando uno de los motores de menor potencia esté parado (16V50DF). De forma normal el buque navegará con uno de los motores 16V50DF y dos motores 18V50DF. La información para estos cálculos se obtiene de la ficha técnica de los motores.

CÁLCULO DEL CONSUMO MOTORES

$$C_{FO} = C_e * PS * t_{nav} * 10^{-6}$$

Siendo, C_e el consumo específico de los motores 18V50DF será de 198 g/kwh y PS la potencia del motor en kw (17.650 kW y dos de 15.600 kW) considerando un 85% de margen. El tiempo de navegación se considerará de 11 días (264 horas), por tanto se obtiene:

$$C_{FO} = 198 * (3 * 17.650) * 0.85 * 264 * 10^{-6}$$

$$C_{FO} = 2227 t$$

El consumo utilizado es el valor más alto (100%fuel), el motor operará de forma normal añadiendo el gas del biol-off y por tanto, el consumo de fuel será algo menor. Se ha optado por este valor para tener un margen de capacidad en el tanque.

Tomando la densidad del fuel como 0,9 t/m³ se obtiene el volumen necesario:

$$Vol_{FO} = 2474 m^3$$

CÁLCULO DEL TANQUE ALMACÉN

El buque llevará dos tanques almacén en proa que tendrán una capacidad total igual al volumen de combustible necesario menos dos días de consumo. Así se asegura la disponibilidad del combustible que será el que más se consuma.

El volumen necesario para dos días de consumo se calculará de la misma forma pero considerando dos días de navegación.

$$C_{FO} = C_e * PS * t_{nav} * 10^{-6} = 284 t \rightarrow V_{2d} = 405 m^3$$

Tomaremos una permeabilidad de 0,98:

$$Vol_{TAFO} = \frac{2474 - 405}{0,98} = 2112 m^3$$

Cada tanque, por tanto deberá tener una capacidad mínima de 1056 m³.

CÁLCULO DEL TANQUE DE SEDIMENTACIÓN

El tanque de sedimentación debe suministrar al tanque de uso diario el fuel, por tanto, se considerará que este tanque tenga capacidad para almacenar el fuel necesario para dos días de navegación. Se tomará una permeabilidad de 0,98.

$$Vol_{TSFO} = 414 m^3$$

Se instalarán dos tanques de sedimentación a cada banda de la cámara de máquinas con una capacidad mínima de 207 m³ cada uno.

CÁLCULO DEL TANQUE DE USO DIARIO

Se instalarán dos tanques de uso diario a cada banda de la cámara de máquinas que tendrán la capacidad para albergar el consumo de un día de navegación cada uno.

Tomando una permeabilidad de 0,98 cada tanque tendrá:

$$Vol_{UDFO} = 203 m^3$$

5.2. CAPACIDADES TANQUES DE DIESEL.

El diesel se utilizará en el momento de arranque del buque y en zonas de puerto o zonas protegidas. Se estimará una capacidad para los tanques que corresponda a tres días de navegación. Se tomará una densidad de 0,9 t/m³, un consumo de 198 g/kwh y 0,97 de permeabilidad.

$$C_{DO} = C_e * PS * t_{nav} * 10^{-6} = 607 \text{ t}$$

$$Vol_{TDO} = 696 \text{ m}^3$$

Se instalarán dos tanques de diesel a cada banda de la cámara de máquinas con una capacidad cada uno de 348 m³.

5.3. CAPACIDADES TANQUES DE ACEITE.

Para este cálculo se tendrá en cuenta el consumo de aceite obtenido del catálogo de los motores 18V50DF para una autonomía de 11 días (264 h). A continuación se muestra el cálculo.

$$C_{AC} = C_e * PS * t_{nav} * 10^{-6} = 5,8 \text{ t}$$

El consumo de aceite total será por tanto $C_{AC} = 5,8 \text{ t}$

El volumen teniendo en cuenta la densidad 0,9 t/m³ resulta

$$Vol_{AC} = 6,5 \text{ m}^3$$

A este volumen hay que añadirle el volumen que define necesario el catálogo de los motores. Siendo este volumen de 15 m³ para los motores 18V50DF.

El volumen total necesario y teniendo en cuenta una permeabilidad de 0,97 será:

$$Vol_{AC} = 70 \text{ m}^3$$

Se instalarán dos tanques de aceite, uno a cada banda del buque. Cada tanque tendrá una capacidad de 35 m³.

5.4. CAPACIDADES TANQUES DE AGUA DULCE.

Para estimar la cantidad de agua dulce necesaria se tendrá en cuenta la norma UNE EN ISO 15748 que considera 175 litros por persona y día. El buque tiene capacidad para 40 tripulantes y 11 días de autonomía, por tanto y teniendo en cuenta un permeabilidad de 0,97 se obtiene:

$$Vol_{AD} = 79.382 \text{ l} \approx 80 \text{ m}^3$$

Se instalarán un tanque a cada banda del buque a popa del pique de popa. Cada tanque con una capacidad de 40 m³.

5.5. CAPACIDADES TANQUES DE AGUAS GRISES Y NEGRAS.

A partir de la norma UNE EN ISO 15749 de desagües en embarcaciones se considerará que cada tripulante generará 180 l/día de aguas sucias. Por tanto la capacidad necesaria total teniendo en cuenta los 40 tripulantes y una permeabilidad de 0,97:

$$Vol_{TAGN} = 81.650 \text{ l} \approx 82 \text{ m}^3$$

Se colocará UN tanque en la cámara de máquinas.

5.6. CAPACIDADES TANQUES DE LODOS.

El tanque de lodos lo dimensionaremos de acuerdo con el convenio MARPOL. En el Anexo I, Regla 17 se define a modo de orientación la capacidad adecuada del tanque de lodos en buques que no lleven agua de lastre en los tanques de fuel oil.

$$Vol_{LOD} = K * C * D$$

Siendo $k=0,01$ para buques que utilicen fuel oil pesado para la máquina principal, C el consumo diario de fuel 203 m³ y D la duración máxima entre puertos en los que se pueda descargar este tipo de lodos, tomaremos este valor como el dato de la autonomía (11 días).

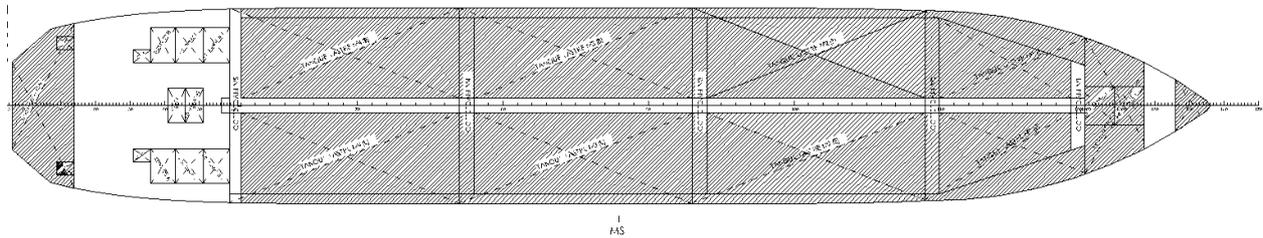

$$Vol_{LOD} = 23 \text{ m}^3$$

5.7. COMPROBACIÓN CAPACIDAD TANQUES.

TANQUES	m3 mínimo	m3 reales
F.O. ALMACÉN (2)	1.056	1.187,30
F.O. ALMACÉN (1)	1.056	1.187,30

ACEITE (B)	35	51,8
AGUA DULCE (E)	40	48
AGUA DULCE (B)	40	48
AGUAS SUCIAS	41	79,8
LODOS	23	79,8

5.8. CAPACIDADES TANQUES DE LASTRE.

A continuación se muestra las capacidades totales de cada tanque de lastre obtenidos a partir del Maxsurf y su ubicación en el buque.

TANQUE LASTRE PROA-BULBO	3200,305
TANQUE LASTRE PROA DF	584,789
TANQUE LASTRE POPA	1743,618
TANQUE LASTRE DC Nº1 (E)	3216,820
TANQUE LASTRE DC Nº1 (B)	3216,820
TANQUE LASTRE DC Nº2 (B)	4034,831
TANQUE LASTRE DC Nº2 (E)	4034,831
TANQUE LASTRE DC Nº3 (B)	4686,973
TANQUE LASTRE DC Nº3 (E)	4686,973
TANQUE LASTRE DC Nº4 (B)	3246,993
TANQUE LASTRE DC Nº4 (E)	3246,993
TANQUE LASTRE COFFERDAM Nº2	4151,561
TANQUE LASTRE COFFERDAM Nº3	4298,209
TANQUE LASTRE COFFERDAM Nº4	4243,858
TOTAL	48593,575

La Capacidad de lastre del buque será de 48.594 m³. El buque proyecto cumplirá que la suma del peso en rosca (39.863 t), el peso de lastre y contando 10% de consumos será lo suficiente para sumergir la hélice en su totalidad. Se obtendrá a partir de las curvas de KN (calculadas en el punto 6).

5.9. CAPACIDADES TANQUES DE CARGA.

Se muestra la capacidad de los tanques de carga obtenidos a partir del Maxsurf y se detalla los requerimientos del proyecto.

TANQUE GAS Nº 1	29685,60
TANQUE GAS Nº 2	47291,96
TANQUE GAS Nº 3	47112,03
TANQUE GAS Nº 4	44838,93
TOTAL (m3)	168928,51
PESO (t)	76017,83

Del reporte de Maxsurf se obtiene una capacidad total de 168.929 m³. La capacidad requerida son 160.000 m³, teniendo en cuenta una permeabilidad del 0,97:

$$V(m^3) = \frac{160.000}{0,97} = 164.949$$

Se debe tener en cuenta el capítulo 15 del Código Internacional de Gaseros (CIG) que pone límite al llenado del tanque. Este límite de llenado no excederá del 98%, por tanto:

$$V_{REQUERIDO} = \frac{164.949}{0.98} = 168.314,7 m^3$$

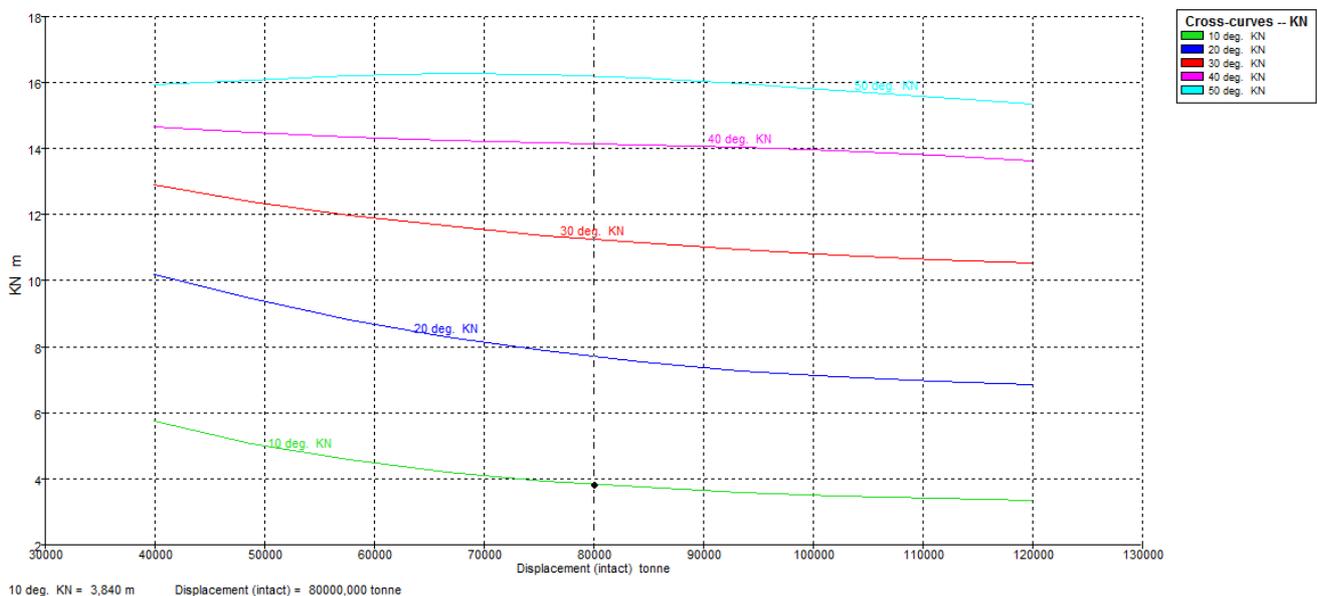

Como puede comprobarse, se cumple lo especificado en la RPA del proyecto. Si tomamos la densidad del gas licuado como 0,45 t/m³, se obtendría un peso de 76.524 t.

6. CURVA DE KN.

Se calculará a partir de un desplazamiento inicial que tomaremos como el peso en rosca hasta nuestro desplazamiento final utilizando 10 incrementos de desplazamiento. Los ángulos de escora variarán de 10° a 50°.

Se tomarán valores de -1%Lpp, 1%Lpp y para asiento 0. A continuación se muestran los resultados:

7. CURVAS HIDROSTÁTICAS.

Estas curvas definen el comportamiento de la carena para diferentes calados. Se calcularán para diferentes calados haciendo coincidir los valores con los utilizados en el cálculo de las curvas KN.

Estos cálculos hidrostáticos se realizarán para asiento -1%Lpp, +1%Lpp y para asiento 0.

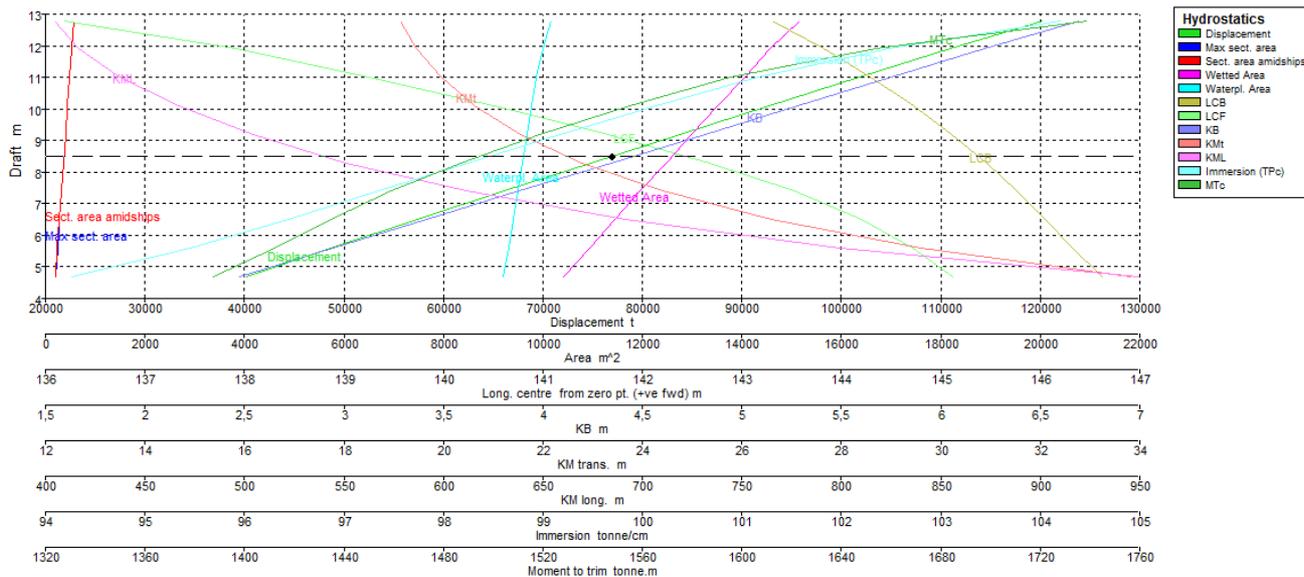

A continuación se muestran los resultados:

ANEXO II. Fichas motores generadores.

3.7 Wärtsilä 18V50DF

Wärtsilä 18V50DF		DE		DE	
		Gas mode	Diesel mode	Gas mode	Diesel mode
Cylinder output	kW	950		975	
Engine speed	rpm	500		514	
Engine output	kW	17100		17550	
Mean effective pressure	MPa	2.0		2.0	
IMO compliance		Tier 3	Tier 2	Tier 3	Tier 2
Combustion air system (Note 1)					
Flow at 100% load	kg/s	27.5	33.8	27.5	33.7
Temperature at turbocharger intake, max.	°C	45		45	
Temperature after air cooler, nom. (TE 601)	°C	45	50	45	50
Exhaust gas system					
Flow at 100% load	kg/s	27.0	32.4	28.8	34.2
Flow at 75% load	kg/s	21.6	27.0	21.6	27.0
Flow at 50% load	kg/s	16.2	18.0	16.2	19.8
Temperature after turbocharger at 100% load (TE 517)	°C	375	345	378	347
Temperature after turbocharger at 75% load (TE 517)	°C	424	332	428	330
Temperature after turbocharger at 50% load (TE 517)	°C	430	377	433	373
Backpressure, max.	kPa	4		4	
Calculated exhaust diameter for 35 m/s	mm	1339	1432	1386	1474
Heat balance at 100% load (Note 2)					
Jacket water, HT-circuit	kW	1962	2898	2808	3024
Charge air, HT-circuit	kW	2700	3636	2034	3906
Charge air, LT-circuit	kW	1350	1836	1386	1890
Lubricating oil, LT-circuit	kW	1386	2178	1422	2250
Radiation	kW	468	504	486	540
Fuel consumption (Note 3)					
Total energy consumption at 100% load	kJ/kWh	7410	-	7440	-
Total energy consumption at 75% load	kJ/kWh	7740	-	7780	-
Total energy consumption at 50% load	kJ/kWh	8410	-	8440	-
Fuel gas consumption at 100% load	kJ/kWh	7365	-	7397	-
Fuel gas consumption at 75% load	kJ/kWh	7677	-	7710	-
Fuel gas consumption at 50% load	kJ/kWh	8300	-	8336	-
Fuel oil consumption at 100% load	g/kWh	1.0	187	1.0	189
Fuel oil consumption at 75% load	g/kWh	1.5	187	1.5	188
Fuel oil consumption 50% load	g/kWh	2.4	198	2.4	198
Fuel gas system (Note 4)					
Gas pressure at engine inlet, min (PT901)	kPa (a)	472	-	472	-
Gas pressure to Gas Valve unit, min	kPa (a)	592	-	592	-
Gas temperature before Gas Valve Unit	°C	0...60	-	0...60	-

Wärtsilä 18V50DF		DE		DE	
		Gas mode	Diesel mode	Gas mode	Diesel mode
Cylinder output	kW	950		975	
Engine speed	rpm	500		514	
Fuel oil system					
Pressure before injection pumps (PT 101)	kPa	800±50		800±50	
Fuel oil flow to engine, approx	m ³ /h	18.0		18.6	
HFO viscosity before the engine	cSt	-	16...24	-	16...24
Max. HFO temperature before engine (TE 101)	°C	-	140	-	140
MDF viscosity, min.	cSt	2.0		2.0	
Max. MDF temperature before engine (TE 101)	°C	45		45	
Leak fuel quantity (HFO), clean fuel at 100% load	kg/h	-	13.6	-	13.6
Leak fuel quantity (MDF), clean fuel at 100% load	kg/h	36.1	68.0	36.1	68.0
Pilot fuel (MDF) viscosity before the engine	cSt	2...11		2...11	
Pilot fuel pressure at engine inlet (PT 112)	kPa	400...800		400...800	
Pilot fuel outlet pressure, max	kPa	150		150	
Pilot fuel return flow at 100% load	kg/h	325		325	
Lubricating oil system (Note 5)					
Pressure before bearings, nom. (PT 201)	kPa	400		400	
Pressure after pump, max.	kPa	800		800	
Suction ability, including pipe loss, max.	kPa	40		40	
Priming pressure, nom. (PT 201)	kPa	80		80	
Temperature before bearings, nom. (TE 201)	°C	63		63	
Temperature after engine, approx.	°C	78		78	
Pump capacity (main), engine driven	m ³ /h	335		345	
Pump capacity (main), electrically driven	m ³ /h	335		335	
Oil flow through engine	m ³ /h	260		260	
Priming pump capacity (50/60Hz)	m ³ /h	100.0 / 100.0		100.0 / 100.0	
Oil volume in separate system oil tank	m ³	25		25	
Oil consumption at 100% load, approx.	g/kWh	0.5		0.5	
Crankcase ventilation flow rate at full load	l/min	4200		4200	
Crankcase volume	m ³	44.3		44.3	
Crankcase ventilation backpressure, max.	Pa	500		500	
Oil volume in turning device	l	68.0...70.0		68.0...70.0	
Oil volume in speed governor	l	6.2		6.2	
HT cooling water system					
Pressure at engine, after pump, nom. (PT 401)	kPa	250 + static		250 + static	
Pressure at engine, after pump, max. (PT 401)	kPa	480		480	
Temperature before cylinders, approx. (TE 401)	°C	74		74	
Temperature after charge air cooler, nom.	°C	96		96	
Capacity of engine driven pump, nom.	m ³ /h	400		400	
Pressure drop over engine, total	kPa	50		50	
Pressure drop in external system, max.	kPa	150		150	

Wärtsilä 18V50DF		DE		DE	
		Gas mode	Diesel mode	Gas mode	Diesel mode
Cylinder output	kW	950		975	
Engine speed	rpm	500		514	
Pressure from expansion tank	kPa	70...150		70...150	
Water volume in engine	m ³	2.6		2.6	
LT cooling water system					
Pressure at engine, after pump, nom. (PT 471)	kPa	250+ static		250+ static	
Pressure at engine, after pump, max. (PT 471)	kPa	440		440	
Temperature before engine, max. (TE 471)	°C	55		55	
Temperature before engine, min. (TE 471)	°C	36		36	
Capacity of engine driven pump, nom.	m ³ /h	400		400	
Pressure drop over charge air cooler	kPa	30		30	
Pressure drop in external system, max.	kPa	200		200	
Pressure from expansion tank	kPa	70...150		70...150	
Starting air system (Note 6)					
Pressure, nom. (PT 301)	kPa	3000		3000	
Pressure at engine during start, min. (20 °C)	kPa	1000		1000	
Pressure, max. (PT 301)	kPa	3000		3000	
Low pressure limit in starting air vessel	kPa	1800		1800	
Consumption per start at 20 °C (successful start)	Nm ³	9.0		9.0	
Consumption per start at 20 °C (with slowturn)	Nm ³	10.8		10.8	

Notes:

Note 1 At Gas LHV 49620kJ/kg

Note 2 At 100% output and nominal speed. The figures are valid for ambient conditions according to ISO 15550, except for LT-water temperature, which is 35°C in gas operation and 45°C in back-up fuel operation. And with engine driven water, lube oil and pilot fuel pumps.

Note 3 According to ISO 15550, lower calorific value 42700 kJ/kg, with engine driven pumps (two cooling water + one lubricating oil pumps). Tolerance 5%. Gas Lower heating value >28 MJ/m³N and Methane Number High (>80). The fuel consumption BSEC and SFOC are guaranteed at 100% load and the values at other loads are given for indication only.

Note 4 Fuel gas pressure given at LHV ≥ 36MJ/m³N. Required fuel gas pressure depends on fuel gas LHV and need to be increased for lower LHV's. Pressure drop in external fuel gas system to be considered. See chapter Fuel system for further information.

Note 5 Lubricating oil treatment losses and oil changes are not included in oil consumption. The lubricating oil volume of the governor is depending of the governor type.

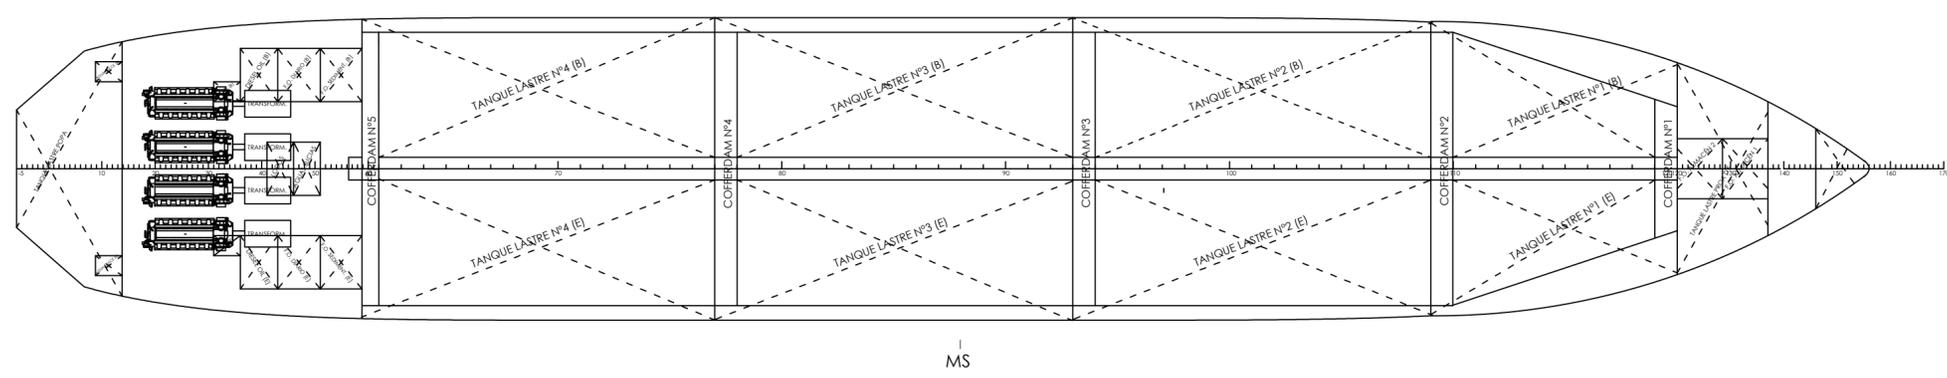

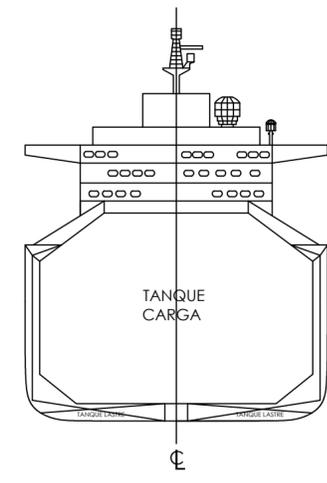

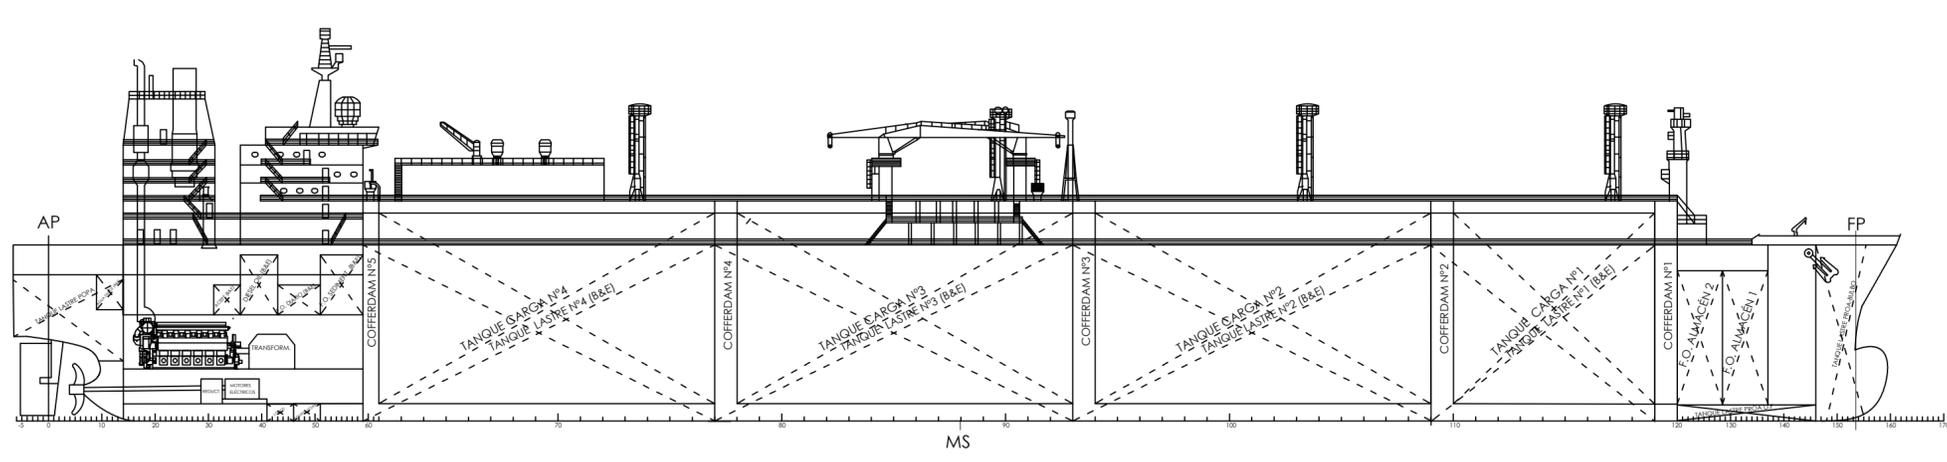

Note 6 At manual starting the consumption may be 2...3 times lower.

ME = Engine driving propeller, variable speed

DE = Diesel-Electric engine driving generator

Subject to revision without notice.
