## Supplementary Methods

### Microarray hybridization and Transcriptomic analysis

Whole mouse gene expression microarray analysis was performed using the available SurePrint G3 Mouse GE v2 8x60K Microarray (Agilent Microarray Design ID: ID 074809, Agilent Technologies). Nucleic acid from each replicate, 100 ng, were labeled following the Agilent protocol "Gene Expression FFPE Workflow". Briefly, cDNA library was generated and amplified using TransPlex Whole Transcriptome Amplification System (Sigma-Aldrich, Spain). The Titanium Taq DNA polymerase (Takara, Saint-Germain-en-Laye, France) was used during the cDNA library amplification step. Amplified cDNA was purified using the QIAquick PCR Purification kit (Qiagen, Hilden, Germany) and quantified using the NanoDrop 1000 spectrophotometer. The SureTag Labeling kit (Agilent Technologies) was used to enzymatically label 1.8 µg of amplified cDNA with cyanine 3-dUTP. Cy3-labeled cDNA samples were cleaned up using an Amicon Ultra-0.5 with Ultracel-30 Membrane, 30 kDa filter, provided with the SureTag Labeling kit. Yield and specific activity were determined using the NanoDrop 1000 spectrophotometer. The purified Cy3-labeled cDNA samples were hybridized to the Agilent SurePrint G3 Mouse GE v2 8x60K Microarray following the manufacturer instructions. Hybridized microarrays were scanned on a G2565CA DNA microarray scanner (Agilent Technologies).

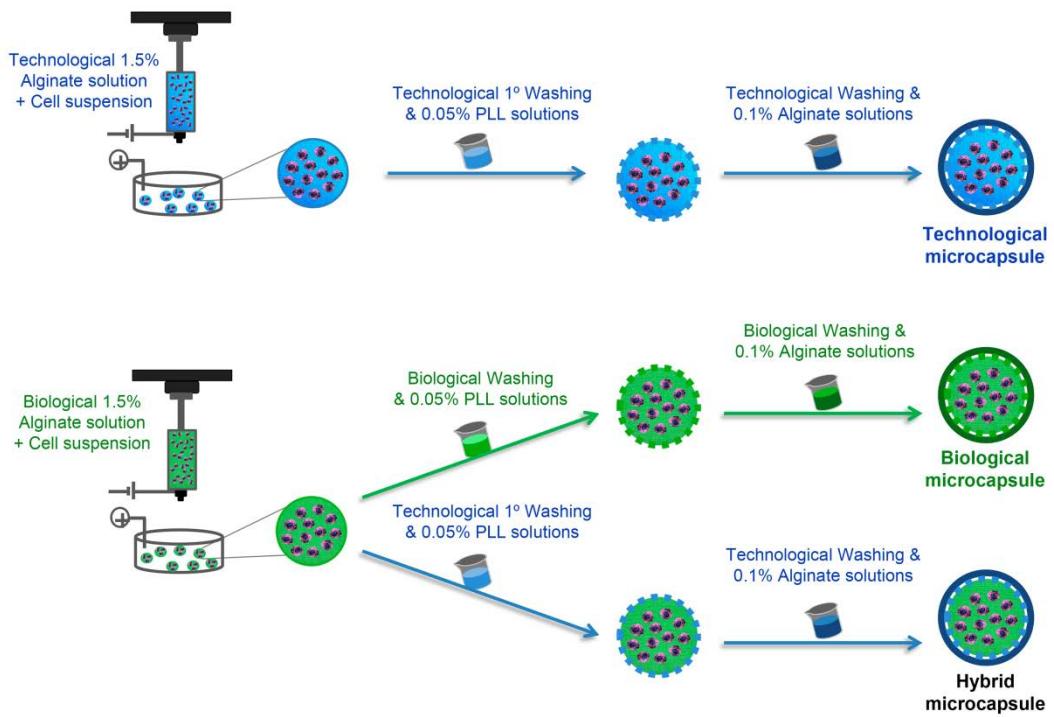

Conventional statistical criteria (adjusted p-value < 0.05) were used for the selection of differentially expressed genes. For each differentially expressed gene the fold change (FC) was calculated as follows:  $\log_2(\text{FC}) = \log_2(\text{Technological data}) - \log_2(\text{Biological data})$ , and the absolute FC was calculated according to the following formula [1]: if  $\log_2(\text{FC}) > 0$ ,  $\text{FC} = 2^{(\log_2(\text{FC}))}$ ; if  $\log_2(\text{FC}) < 0$ ,  $\text{FC} = (-1) \times 2^{-(\log_2(\text{FC}))}$ . Positive and negative values of FC showed up-regulated or down-regulated genes on Technological microcapsules, respectively.

All microarray procedures were performed at the Gene Expression Unit of the Genomics Facility in the UPV/ EHU (SGIker platforms; Leioa, Spain). PANTHER Gene List Analysis Tools (<http://pantherdb.org/>) and National Center for Biotechnology Information databases (<https://www.ncbi.nlm.nih.gov/>) were used to detect the biological activity of genes. The heat maps and clustering of differentially expressed genes were constructed using Heatmapper ([www.heatmapper.ca](http://www.heatmapper.ca)) [2]. For gene and protein nomenclature, the guidelines of Mouse Nomenclature Home Page of Mouse Genome Informatics (MGI) were followed (<http://informatics.jax.org/mgihome/nomen/>).

## Supplementary figures

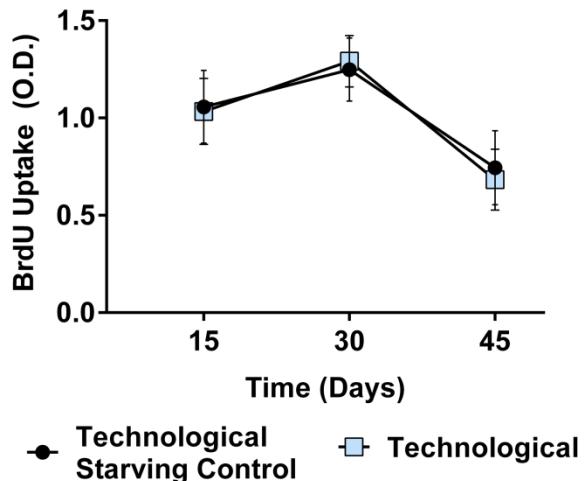

**Supplementary S1. Schematic representation of the synthesis of Biological, Technological and Hybrid microcapsules. PLL - Poly-L-Lysine**

**Supplementary S2. Preliminary studies to design the Biological 1.5% Alginate solution.**  
 Live/dead flow cytometry and CCK-8 metabolic assays were performed to select the most suitable vehicle containing electrolytes for the Biological 1.5% Alginate solution. Among them, DMEM w/o  $\text{Ca}^{+2}, \text{Mg}^{+2}$  demonstrated to provide the best results for cell viability and metabolic activity. Graphs symbolize mean  $\pm$  SD ( $n = 3$  for cell viability studies,  $n = 7$  for metabolic assays). Statistical significance: \* $p < 0.05$ , \*\* $p < 0.01$  and \*\*\* $p < 0.001$ . DMEM - Dulbecco's modified Eagle's medium; HBSS - Hanks balanced salt solution; PBS - Phosphate buffered saline.

**Supplementary S3. Microcapsule permeability.** FITC-labeled dextran diffusion ( $n = 4$ ) showed no statistically significant differences in the molecular weight cut off. Scale bars = 400  $\mu\text{m}$ .

**Supplementary S4. D1-MSCs present an aggressive proliferative capacity.** During bromodeoxyuridine (BrdU) uptake assays, when comparing results of Technological samples (incubated in DMEM with 10% FBS supplementation) to the starving control (same Technological microcapsules incubated in DMEM with 0.1% FBS supplementation) no statistical differences were found, confirming the high proliferative capacity of these cells. Graphs symbolize mean  $\pm$  SD ( $n = 5$ ). DMEM - Dulbecco's modified Eagle's medium, FBS - fetal bovine serum.

**Supplementary Table 1. Sequences that showed significant expression differences ( $p < 0.05$ ) and a Fold Change  $> 3$  or  $< -3$  in the analysis of microarray data.**

<sup>a</sup>Probe Name on the SurePrint G3 Mouse GE v2 8x60K Microarray (Agilent Microarray Design ID: ID 074809, Agilent Technologies)

<sup>b</sup>Entrez Gene ID: stable identifiers for genes and other loci for a subset of model organisms on the National Center for Biotechnology Information databases (<https://www.ncbi.nlm.nih.gov/gene>)

<sup>c</sup>UniGene ID: identifierNCBI database of the transcriptome (<https://www.ncbi.nlm.nih.gov/unigene>)

<sup>d</sup>Gen Ontology (GO): GO defines concepts/classes used to describe gene function, and relationships between molecular function, cellular component and biological process,

<sup>e</sup>Fold Change (FC): FC was calculated according to the following formula (Leonhardt et al, 2004): if  $\log_2(FC) > 0$ ,  $FC = 2^{(\log_2(FC))}$ ; if  $\log_2(FC) < 0$ ,  $FC = (-1) \times 2^{-(\log_2(FC))}$ , Positive and negative values of FC showed up-regulated or down-regulated genes on Technological microcapsules, respectively,
