1 TÍTULO Y RESUMEN

1.1 Castellano

El buque que se proyectará en este trabajo es uno para el transporte de un gran volumen de crudo, un petrolero de crudo VLCC, cuya característica principal es su capacidad de carga máxima de 275000 toneladas de peso muerto, según la RPA. En estos cuadernos se recoge el proceso completo de diseño, construcción y evaluación económica desarrollado para la obtención de dicho buque.

1.2 Galego

O buque que se proxecta neste traballo é un para o transporte dun gran volume de crudo, un petroleiro de crudo VLCC, cuxa característica principal é a súa capacidade de carga máxima, dada pola RPA, 275000 toneladas de peso morto. Nestes cadernos recóllese o proceso completo de deseño, construción e avaliación económica desenrolado para a obtención de dito buque.

1.3 English

The ship that will be projected in this work is one for the transport of a large volume of crude, a very large crude oil tanker (VLCC), whose main characteristic is its maximum load capacity of 275,000 deadweight tons, according to the PAR. These notebooks collect the complete process of design, construction and economic evaluation developed to obtain the mentioned ship.

TRABAJO FIN DE GRADO

CURSO 2020-2021

PROYECTO NÚMERO

TIPO DE BUQUE: Petrolero (tanque de crudos)

CLASIFICACIÓN, COTA Y REGLAMENTOS DE APLICACIÓN: DNV, SOLAS, MARPOL

CARACTERÍSTICAS DE LA CARGA: 275000 toneladas de peso muerto

VELOCIDAD Y AUTONOMÍA: 15.5 nudos en condiciones de servicio. 20000 millas a velocidad de servicio.

SISTEMAS Y EQUIPOS DE CARGA / DESCARGA: Bombas para carga y descarga de tanques.

PROPULSIÓN: Motor diésel acoplado a una hélice de paso fijo.

TRIPULACIÓN Y PASAJE: 36 personas distribuidas en camarotes individuales y dobles.

OTROS EQUIPOS E INSTALACIONES: Los habituales en este tipo de buques.

Ferrol, 04 de Octubre de 2020

2 INTRODUCCIÓN

En este cuaderno se realizará la compartimentación del buque a proyectar, la disposición y la capacidad de los tanques. Además, con la ayuda del programa Maxsurf, se realizará el estudio de las curvas hidrostáticas, los brazos de adrizamiento (KN) y se hará una definición de la zona estanca del buque a tratar.

El compartimentado del buque a tratar se realiza en tres partes:

- Compartimentado longitudinal.
- Compartimentado transversal.
- Compartimentado vertical.

Para el estudio del buque proyecto, este será dividido en las siguientes zonas:

- Zona de proa.
- Zona de popa.
- Zona de carga.
- Zona de máquinas.

La disposición estará en cumplimiento de las normas impuestas por la IMO, que en el caso a tratar son el SOLAS, MARPOL y la sociedad de clasificación DNV.

Para poder desarrollar este cuaderno, se usan las dimensiones obtenidas de los cuadernos anteriores:

<i>Lpp (m)</i>	302.9
<i>B (m)</i>	56.5
<i>D(m)</i>	29.40
<i>T(m)</i>	21.97
<i>Cb</i>	0.865
<i>Cm</i>	0.989
<i>Cp</i>	0.875
<i>Fn</i>	0.14
<i>Pot (kW)</i>	37680
<i>Δ (t)</i>	339242
<i>Peso en Rosca (t)</i>	43066.06
<i>TPM</i>	275000

3 COMPARTIMENTADO LONGITUDINAL

En este apartado se realiza una subdivisión del volumen interno del buque en el sentido de la eslora. Lo que se corresponde con los mamparos transversales estancos.

Por definición, el mamparo estanco se extiende desde el fondo del buque hasta la cubierta de francobordo de este. En el caso del buque desarrollado en este trabajo, coincide con la cubierta principal.

Los mamparos estancos de los que se dispondrá en el buque proyectado son:

- Mamparos transversales:
 - Mamparo de pique de proa.
 - Mamparo de popa de los tanques Slop.
 - Mamparo de los tanques de carga (6 mamparos).
 - Mamparo de pique de proa o mamparo de colisión.
- Además de estos, el buque tratado llevará un mamparo longitudinal situado en crujía, este ayuda a la estabilidad en operaciones de carga e descarga.

El buque a tratar es un petrolero de crudo, por lo que dicho compartimentado será de vital importancia, porque tras definir los espacios necesarios para el funcionamiento del barco quedará definido el espacio dedicado a la estiba de carga.

3.1 Separación entre cuadernas

La posición longitudinal de los mamparos transversales estancos ha de coincidir con una cuaderna numérica, por lo que es necesario definir un espaciado de cuadernas.

Tomando como referencia al buque base y otros del mismo orden, se pueden ajustar unas medidas a nuestras dimensiones. Además, la separación de las cuadernas en las secciones de proa y popa será menor, por sufrir estas zonas unos esfuerzos mayores.

El DNV, a pesar de no imponer un valor concreto para la separación entre cuadernas, si establece unos valores máximos para el buque a tratar:

ZONA	MÍNIMO ESTIMADO (mm)
Cuerpo de Proa	$470+(L/0.6)$
Cámara de máquinas	700
Cuerpo central	$510+(L/0.6)$
Cuerpo de Popa	$470+(L/0.6)$

Para no exceder los máximos establecidos, y basando las decisiones en la teoría dada en la Asignatura de Proyectos del Buque y Artefactos Marinos I, se toman los siguientes espaciados:

- Zona 1: desde el espejo de popa hasta el mamparo de popa del cofferdam, el cual está situado a 32.9 m desde la perpendicular de popa. La separación de cuadernas desde el espejo de popa hasta la cuaderna 57 situada a 33.6 m de la perpendicular de popa es de 0.7m.
- Zona 2: desde el mamparo de popa de cofferdam hasta el mamparo de colisión. Desde la cuaderna 57 hasta la cuaderna 148 "mamparo de colisión" (a 266.3 m de la perpendicular de popa) la separación entre cuadernas es de 2.6 m. Desde esta cuaderna hasta el final de la proa del buque, la separación de cuadernas se vuelve a hacer de 0.7 m debido a la complejidad de sus formas en el cuerpo de entrada.

4 ZONA DE PROA

Esta zona se extiende a proa de la zona de carga y va hasta el final del buque por la parte de delante. Esta zona de proa se usa para:

- Desarrollar un espacio para la protección de la zona de carga.
- Albergar un tanque de lastre (pique de proa) necesario para corregir los trimados el buque desarrollado.
- En este espacio son colocados los equipos de amarre y fondeo.
- Debajo de la cubierta hay un espacio destinado al almacenaje de las herramientas de cubierta.

4.1 Mamparo de colisión

La zona de proa está limitada por un mamparo transversal estanco que se sitúa desde el fondo hasta la cubierta principal y se extiende de babor a estribor. El mamparo anteriormente mencionado se denomina mamparo de colisión y su posición viene regulada por el DNV parte 3, capítulo 2, sección 2.

$$\begin{aligned}
 x_{c-min} &= 0.05L_{LL} - x_f \text{ for } L_{LL} < 200 \text{ m} \\
 &= 10 - x_f \text{ for } L_{LL} \geq 200 \text{ m} \\
 x_{c-max} &= 0.05L_{LL} + 3.0 - x_f \text{ for } L_{LL} < 100 \text{ m} \\
 &= 0.08L_{LL} - x_f \text{ for } L_{LL} \geq 100 \text{ m}
 \end{aligned}$$

where:

$$x_f = \text{adjustment of reference point due to bulbous bow in m, as given in [4.1.2].}$$

En el caso a tratar hay ausencia de bulbo, además la eslora entre perpendiculares del buque proyectado es de 308.9 m, cuyo valor se toma como L_{LL} . Por lo tanto:

- Distancia mínima: 5% de 308.9 m = 15.5 m a popa de la perpendicular de proa ó 10 m (se escoge el menor).
- Distancia máxima: 8% de 308.9 m = 24.7 m a popa de la perpendicular de proa.

De modo que, la distancia del pique de proa estará entre 10 metros mínimos y 24.7 m máximos.

Para concluir, en el buque proyectado, se decide situar a 292.2 m de la perpendicular de Popa, en la cuaderna 176. Esto se muestra en la imagen de a continuación:

5 ZONA DE POPA

El conocido como pique de popa está delimitado por el mamparo más a popa del buque. Dicho mamparo tendrá como función encerrar el local del servomotor y tanques de lastre dentro de un compartimento estanco.

Según el DNV, el mamparo del pique de popa es obligatorio, aunque este no impone unas normas para su instalación y ubicación. Viene definido en el DNV parte 3 capítulo 2 sección 2.

En virtud de lo cual, teniendo en cuenta el espaciado entre cuadernas anteriormente definido y usando el buque base como referencia, se decide colocar dicho mamparo a 11.2 m a proa de la perpendicular de popa, en la cuaderna 16.

6 ZONA DE CARGA

La zona de carga es aquella destinada a albergar la carga transportada en el buque diseñado.

Durante el diseño, es considerado como parámetro crítico, el volumen útil de esta zona ya que el buque debe ser proyectado de acuerdo con las especificaciones impuestas durante las fases preliminares, en este caso de 275000 TPM.

El Convenio Marpol es el encargado de regular los parámetros y dimensiones que han de caracterizar a esta zona, además de las propias normas de la Sociedad de Clasificación, en este caso, DNV. Ambas regulaciones coinciden en los criterios fundamentales que regulan.

El mamparo de colisión se sitúa desde el mamparo de proa de la cámara de máquinas hasta el mamparo de colisión, además se debe disponer de doble casco y doble fondo a lo largo de toda su eslora.

6.1 Doble fondo

La altura del doble fondo es recogida en el convenio Marpol Anexo I Capítulo 3 Regla 12 A, además de en los apuntes de la asignatura de Proyectos del Buque y Artefactos Marinos I. La distancia mínima es la menor de:

$$h_{df} = \frac{B}{15} = 3.8 \text{ m ó } 2 \text{ m}$$

Por lo tanto, se establece una altura mínima de doble fondo entre 2 y 3.8 m, en el caso a tratar de:

$$h_{df} = 2.5 \text{ m}$$

6.2 Doble casco

Al igual que el doble fondo, las distancias mínimas del doble casco están definidas en el Marpol anexo 1 capítulo 3 regla 12, como la distancia mínima entre:

$$w_{dc} = 0.5 + \frac{DWT}{20000} = 0.5 + \frac{275000}{20000} = 14.25 \text{ m ó } 2 \text{ m}$$

En el caso a proyectar, al igual que el doble fondo, se coge una distancia de 2.5 m.

Los espacios libres entre las zonas de carga y el costado del buque y entre las zonas de carga y el fondo del buque, se aprovecharán como tanques de lastre. Como información adicional de importancia, el convenio Marpol marca que todos aquellos petroleros con un peso muerto superior a 20000 TPM, como el tratado en este trabajo, deben ir provistos de lastre separado, con una capacidad mínima tal que en todas las condiciones de lastre se cumpla que:

- Se permita al buque navegar en condiciones de lastre sin que sea necesario lastrear los tanques de carga.
- El lastre adicional del punto descrito en el apartado anterior, sólo se podrán emplear si los tanques de carga están debidamente lavados según la Regla 35 del Marpol.
- El calado de trazado de la cuaderna maestra nunca será inferior a:

$$T_m = 2 + (0.02 * L)$$

- Los calados de las perpendiculares de popa y proa se corresponderán con los determinados por el calado en el centro del buque (T_m), con un asiento a popa inferior a:

$$0.0155 * L$$

- El calado en popa debe garantizar siempre la total inmersión de la hélice.

6.3 Cofferdam

A proa de la cámara de bombas, se sitúa un cofferdam que la separe de la zona de carga.

Según las Sociedades de Clasificación, este es obligatorio para buques de carga líquida como el tratado en este proyecto, y además el espaciado mínimo de esta zona es de 600 mm.

6.4 Tanques de carga

El convenio Marpol, anexo I, capítulo 4, regla 26, establece que la eslora máxima de los tanques de carga ha de ser:

$$L_{max} = \left(0.25 * \frac{bi}{B} + 0.15 \right) * L$$

Donde,

- B es la manga de buque proyectado.
- bi es la distancia entre el costado del buque y el mamparo longitudinal exterior del tanque de carga, mediada de forma perpendicular a crujía. En el caso diseñado, coincide con la anchura del doble casco, 2.5 m.

Entonces,

$$L_{max} = 49.8 \text{ m}$$

La zona de la cántara estará ubicada a popa de los tanques slops. Además, siguiendo las pautas recomendadas, se dispone la zona de carga con dos mamparos longitudinales, de manera que los tanques quedan agrupados de tres en tres; consiguiendo así una reducción de la influencia de las superficies libres sobre la estabilidad.

Por lo tanto, para la condición anteriormente descrita la eslora máxima de los tanques de carga queda definida como:

$$L_{max} = 0.2 * L_{pp} = 61.8 \text{ m}$$

Una disposición muy común a la hora de repartir los tanques de carga en buques similares es de 15 tanques dentro de la zona de carga. En el caso a proyectares, será usada la misma técnica, por tanto la eslora de los tanques será menor a la máxima permitida por el Marpol.

La longitud de los tanques será:

TANQUES		LONGITUD (m)
TANQUE 1	<i>Babor</i>	51.1
	<i>Central</i>	51.1
	<i>Estribor</i>	51.1
TANQUE 2	<i>Babor</i>	48.6
	<i>Central</i>	48.6
	<i>Estribor</i>	48.6
TANQUE 3	<i>Babor</i>	53.7
	<i>Central</i>	53.7

	<i>Estribor</i>	53.7
TANQUE 4	<i>Babor</i>	51
	<i>Central</i>	51
	<i>Estribor</i>	51
TANQUE 5	<i>Babor</i>	49
	<i>Central</i>	49
	<i>Estribor</i>	49

La zona de tanques de carga comienza en la cuaderna 50 y va hasta la cuaderna 176.

6.5 Tanques slops

Los tanques de decantación o slops, están situados a proa del cofferdam y a popa de los tanques definidos anteriormente como tanques de carga. Según el convenio Marpol, anexo I capítulo 4 regla 29, el volumen de carga de estos no puede ser inferior al 3% del volumen de carga, a exceptuar de cuándo:

- Existen tanques de lastre separado o tanques dedicados a lastre limpio, de acuerdo a la regla 18 del mismo anexo, el volumen de carga será de entre el 1% y 2%.
- Se ha instalado un sistema de limpieza de los tanques de carga mediante el lavabo con crudos conforme la regla 33, el volumen de carga será también de entre el 1 y 2%.

En el caso a tratar, se cumple las excepciones anteriores, por lo que, el volumen mínimo de estos tanques será del 2% del volumen de carga.

Los petroleros de crudo cuyo peso muerto sea igual o superior a 70000 TPM deben llevar, al menos, dos tanques slop.

Los tanques de decantación deben tener la capacidad suficiente como para retener los vertidos generados por el lavado de tanques, residuos de aceite y residuos sucios de lastre.

Para el dimensionamiento de estos tanques, es necesario definir los consumibles, tripulación y pertrechos. Según los requisitos previos de actividad, la tripulación estará compuesta de 36 personas, por lo que:

- Consumibles: formados por los víveres que consume la tripulación durante el completo desenvolvimiento de la actividad a bordo. Se consideran 5 kg por persona:

$$\text{Consumibles} = 5 * n^{\circ} \text{ tripulación} * \frac{\text{Autonomía}}{Vs * h}$$

Siendo,

- La autonomía de 20000 millas.
- La velocidad de servicio de 15.5 nudos.

Se obtiene,

$$\text{Consumibles} = 9.7 \text{ toneladas}$$

- Tripulación: al tratarse de un buque de transporte de mercancía y no de pasaje, se consideran 125 kg por cada tripulante. Po tanto:

$$\text{Tripulación} = 125 * n^{\circ} \text{ de tripulantes} = 4.5 t$$

- Pertrechos: según el libro de “El proyecto básico del buque mercante” se debe de estimar un peso de entre 10 y 100 t. En este caso son consideradas 75 t.

- Respetos: estos contemplan toda la maquinaria de repuesto, hélice, amarras, estachas, entre otros. Se hace una aproximación de 110 t.

		Peso (t)
Consumibles	Viveres	9.7
Pesos fijos	Tripulación	4.5
	Pertrechos	75
	Respetos	110
TOTAL		199.2

Si el volumen de carga es:

$$V_{carga} = \frac{TPM - Consumos - 199.2}{\rho}$$

Donde,

- Se consideran los 275000 TPM de la RPA.
- Consumos obtenidos en el cuaderno I de combustibles, aceites, agua de refrigeración, agua dulce 9670.22 t.
- ρ es la densidad de la carga, el petróleo crudo presenta una densidad relativa de 0.86.

$$V_{carga} = \frac{275000 - 9670.22 - 199.2}{0.86} = 308291.37 \text{ m}^3$$

Consiguiendo mediante el desarrollo de este cuaderno un volumen de tanques de carga de 308249.057 m^3 .

El volumen mínimo de los tanques de decantación será de:

$$V_{min\ slop} = 0.015 * V_{carga} = 4624.4 \text{ m}^3$$

Como hay dos tanques slop, el volumen mínimo de cada uno de ellos es de:

$$V_{min\ slop} = \frac{4624.4}{2} = 2312.2 \text{ m}^3$$

Por tanto, las dimensiones de dichos tanques quedan:

TANQUES SLOPS	
Puntal tanque (m)	25.6
Manga tanque (m)	25.75
Eslora tanque (m)	5.2 (cuaderna 56)

7 ZONA DE MÁQUINAS

En el buque a proyectar, y como es lo habitual en este tipo de buques, la cámara de máquinas es situada a popa.

En la zona de cámara de máquinas se sitúan tanques de almacenaje y de uso diario de Fuel-Oil, por ello su dimensionamiento y disposición estará regulado por el convenio Marpol 73/78.

La cámara de máquinas se sitúa justo a continuación del pique de popa, y su eslora se puede definir, según el libro de "El proyecto del buque mercante" como:

$$L_{CM} = 0.28 * L_{pp}^{0.670} + 0.48 * MCO(kW)^{0.350}$$

Se obtiene que,

$$L_{CM} = 30.5 \text{ m}$$

En el caso a tratar, y cumpliendo con los requisitos mínimos, se dispone de una zona de máquinas dividida en tres alturas de:

$$L_{CM} = 21.7 \text{ m}$$

Se hace coincidir sus mamparos de popa y proa con los esfuerzos transversales. La cámara de máquinas está situada entre la cuaderna 25 y la cuaderna 56.

Como se ha mencionado, en el interior de la cámara de máquinas se colocan dos plataformas, a parte del propio piso.

El piso estará situado a 2.5 m sobre la línea de base, altura del doble fondo.

La primera plataforma se colocará a unos 9 m de la línea de base y la segunda plataforma a unos 18 m de la línea de base.

8 CÁLCULOS DEL VOLUMEN Y CONSUMO DE LOS TANQUES

8.1 Tanques de lastre

Los tanques de lastre son llenados de agua de mar para así facilitar la navegación del buque cuando éste no satisface las condiciones de estabilidad y trimado debido o bien a la falta de carga o al haber gastado los consumos.

Como ya se ha mencionado con anterioridad, estos tanques se han de disponer en las zonas del buque de doble casco y doble fondo, siendo estos tanques simétricos y quedando divididos por crujía para disminuir las superficies libres.

El buque debe de disponer de suficiente lastre como para garantizar que la hélice quede totalmente sumergida, el calado mínimo ha de ser:

$$T_{min} = Dhélice + 10\%Dhélice = 10.13 + 0.1 * 10.13 = 11.14 \text{ m}$$

Con esto se puede calcular el desplazamiento mínimo:

$$\Delta_{min} = Cb * \rho * Lpp * B * T_{min}$$

$$\Delta_{min} = 0.82 * 1.025 * 308.9 * 56.5 * 11.14 = 163458 \text{ t}$$

El peso del agua de lastre será de:

$$W_{lastre} = \Delta_{min} - Proscas$$

Donde,

- El peso en rosca se conoce del cuaderno II, en este caso de 47320 t.

Entonces,

$$W_{lastre} = 116138 \text{ t}$$

Por tanto, el volumen del agua de lastre es de,

$$V_{lastre} = \frac{W_{lastre}}{\rho} = \frac{116138}{1.025} = 113305.37 \text{ m}^3$$

El Marpol establece que:

- Todo buque petrolero de crudo cuyo peso muerto sea mayor de 20000 t, debe ir provisto de tanques de lastre separados.
- La capacidad de los tanques de lastre será aquella que permita operar al buque con unas ciertas condiciones de seguridad.

8.2 Tanques de consumo

8.2.1 Tanques de agua dulce

Siguiendo la norma ISO 15749 para buques de transporte de mercancía, se establece que el consumo por día es de 150 l/persona*día. Entonces:

$$V_{agua\ dulce} = \frac{150 \frac{l}{día} * 36 \text{ tripulantes} * 20000 \text{ millas}}{15.5 \text{ nudos} * 24 \text{ h} * 1000l} = 290 \text{ m}^3$$

Se dispondrán de dos tanques de agua dulce, de forma que se cumpla ampliamente el consumo de agua dulce.

8.2.2 Tanques de agua técnica

El agua técnica es utilizada para reponer las posibles pérdidas producidas por derrames en el circuito de vapor. El valor total de esta producción es desconocido, por lo que se utiliza el buque de referencia para obtener una estimación.

Se observa que este tiene 2 tanques de agua técnica de unos 300 m³ cada uno de ellos.

8.2.3 Tanques de Fuel Oil

8.2.3.1 Consumo motor principal

Estos tanques deben disponer de un volumen tal que sean capaces de abastecer el motor principal durante el período de autonomía dado por la RPA.

El consumo del motor principal escogido es de 158 g/kWh para una potencia de 28880.26 kW.

La densidad del combustible se toma como 0.94 t/m³.

Teniendo en cuenta el consumo, autonomía, velocidad de servicio y potencia, se puede definir la cantidad de combustible necesario para cumplir con la RPA establecida:

$$\text{Consumo} = \frac{Cep * Pot * Autonomía}{Vs * 10^6} = 5887.85 t$$

Si se divide este valor por la densidad el combustible, se obtiene el volumen de los tanques de fuel oil,

$$V_{fuel\ oil} = \frac{\text{Consumo}}{\rho_{fueloil}} = 6263.7 m^3$$

Este volumen debe de ir distribuido en distintos tanques como el tanque almacén, tanque de sedimentación y tanque de uso diario.

- Tanque de uso diario:
Será suficiente para alimentar el motor principal durante 24h. Por lo que, su volumen es:

$$V_{fuel\ oil_{uso\ diario}} = \frac{Cep * Pot * 24 h}{10^6 * \rho} = 116.5 m^3$$

Se dispondrán de dos tanques de fuel oil de uso diario.

- Tanque de sedimentación:
El fin de este tanque es separar por sedimentación las partículas del Fuel Oil más pesadas, dando como resultado una purificación de este, que tras haber pasado por este proceso se trasiega a los tanques de uso diario.
Para la obtención de su volumen, se considera que debe cumplir con 36 h de funcionamiento del motor principal:

$$V_{fuel\ oil_{sedimentación}} = \frac{Cep * Pot * 36 h}{10^6 * \rho} = 174.8 m^3$$

Se colocan también dos tanques de sedimentación.

- Tanque almacén:
Debe ser capaz de almacenar todo en fuel oil que no se encuentra en los tanques anteriores de uso diario y sedimentación, por lo tanto:

$$V_{fuel\ oil_{almacén}} = V_{fuel\ oil} - V_{fuel\ oil_{uso\ diario}} - V_{fuel\ oil_{sedimentación}}$$

$$V_{fuel\ oil_{almacén}} = 5972.4 m^3$$

Se colocan también dos tanques de fuel oil para almacén, uno a cada costado.

8.2.3.2 Consumo de motores auxiliares

Tomando como referencia el buque base "Hunter Atla", el buque llevará 3 diésel generadores auxiliares del modelo STX-MAN, de los que 2 funcionan normalmente al 85% para generar la potencia eléctrica requerida, mientras que el tercero de ellos será de respeto.

Según el catálogo de la misma empresa, donde se incluye este mismo tipo de motores, el consumo está marcado como 189 g/kWh.

Para obtener el volumen necesario de los tanques para cubrir las necesidades de estos motores y usando un 10% de la potencia del Motor principal:

$$V = \frac{Cep * 0.1 * Pot.* Autonomía}{Vs * \rho * 10^6} = 749.26 m^3$$

$$V_{uso\ diario} = \frac{Cep * 0.1 * Pot.* 24}{\rho * 10^6} = 14.2 m^3$$

$$V_{uso\ diario} = \frac{Cep * 0.1 * Pot.* 36}{\rho * 10^6} = 21.36 m^3$$

8.2.3.3 Consumos calderas

Según el buque base, es necesaria una caldera para calentar la carga.

Auxiliary Boilers
 Number: 2
 Type/Make: Vertical/Kangrim
 Output, each boiler: 45,000kg/h, 20bar g.
 saturated (working pressure)

Con un consumo de unas 3 t/h.

El total de estos consumos se almacenan en 2 tanques grandes para el almacén de Fuel Oil, 2 tanques de uso diario y un tanque de sedimentación.

8.2.4 Tanques Diesel Oil

Para la colocación de estos tanques, se usa el buque tomado como referencia. De él se deduce que dos tanques de Diesel Oil serán colocados en el buque a proyectar, cada uno de ellos de unos 250 m³.

8.2.5 Tanques de aceite

Se puede hacer una estimación conforme a la cual el peso del aceite utilizado en la lubricación de motores es aproximadamente el 4% del peso del combustible de propulsión (Fuel Oil).

Por tanto:

$$Peso\ aceite = 0.04 * (5887.5 + 704.31) = 263.7 t$$

La densidad del aceite es de 0.92 t/m³. Por tanto, el volumen del aceite utilizado será de:

$$Volumen\ aceite = \frac{Peso\ aceite}{\rho} = \frac{263.7}{0.92} = 286.6 m^3$$

Este volumen de aceite es el necesario para abastecer al motor principal, pero se colocará otro tanque de aceite, de reserva, de las mismas dimensiones que el anterior. Entonces,

$$Volumen\ aceite = 286.6 * 2 = 573.2\ m^3$$

8.2.6 Tanque de lodos

Siguiendo el convenio Marpol, es obligatorio para buques de más de 400 GT, disponer de tanques de lodos.

El volumen de este tanque se define como el 1.5% del combustible total del buque. Es decir:

$$V_{lodos} = 0.015 * (V_{fuel\ oil} + V_{diesel\ oil}) = 101\ m^3$$

Este tanque se ha de colocar en el doble fondo de la cámara de máquinas y se supondrá una densidad de lodos de unos 1.5 t/m³.

8.2.7 Tanque de agua grises y negras

Las aguas grises son todas aquellas que deben evacuarse a excepción de las aguas negras. Las aguas negras son aquellas procedentes de retretes, urinarios y bidés, incluyendo zonas médicas (enfermería, hospital, farmacia) y de lavabos y bañeras y descargas de agua de estas zonas. En el caso de incluir espacios donde habiten animales vivos, las descargas de agua de estas zonas también son consideradas aguas negras.

Para los cálculos de capacidad de agua negras y grises se sigue la norma UNE EN ISO 15749.

Tipo de buque	Cantidad mínima de agua de desecho por persona y día en litros			
	Planta sin vacío		Planta con vacío	
	Aguas negras	Aguas negras y grises	Aguas negras	Aguas negras y grises
Buques de pasaje	70	230	25	185
Buques de alta mar exceptuando los de pasaje	70	180	25	135
Los buques costeros pueden conservar los valores recomendados por las autoridades responsables.				
NOTA - Estos valores son los recomendados. Hay que considerar las posibles variaciones debidas a los reglamentos nacionales o a las recomendaciones de las sociedades de clasificación.				

La cantidad mínima de agua de desecho por persona y día en litros correspondiente al buque tratado es de 180 l. Luego, el volumen total de aguas negras y grises es,

$$180 * 36\ tripulantes = 6480\ l = 6.5\ m^3\ día$$

Considerando la autonomía del buque proyectado, la capacidad del tanque debe de ser de:

$$V_{aguas\ residuales} = 6.5 * \frac{20000}{15.5 * 24} = 349.5\ m^3$$

Para estas aguas se considera un volumen de 1.5 t/m³, ya que estas serán aguas sucias generadas durante la navegación.

8.2.8 Tanque de derrame

Usando como base para el razonamiento el buque base de este proyecto, este tanque deberá de disponer de una capacidad de un valor superior a 40 m³. Debido a la geometría

del buque y a la disposición de los demás espacios de este, se dispone de un volumen de 76 m³ para el derrame.

La densidad utilizada para el producto de este tanque será la del petróleo crudo de 0.94 t/m³, ya que el fluido que ocupará este lugar es el petróleo que vaya rebosando.

11 CURVA DE KN

Lo primero que se hace antes de la obtención de estas curvas es llevar a cabo la comprobación de la simetría del buque; para ello, se confirma mediante el programa de Maxsurf Stability, que TCB es igual a 0.

**11.1 Initial Trim = 0 m (+ve by stern)- Specific gravity = 1,025; (Density = 1,025 tonne/m³)- VCG = 16 m;
 TCG = 0 m**
