## **TÍTULO Y RESUMEN**

### **CASTELLANO**

El buque proyectado en este trabajo tiene como fin el transporte de grandes cantidades de crudo. Se trata de un buque VLCC capaz de trasportar, según los requisitos previos de anteproyecto, 285000 toneladas de peso muerto. En estos cuadernos se realiza una primera aproximación detallada del diseño, construcción, equipamiento y viabilidad económica de un proyecto de estas características.

### **GALEGO**

O buque proxectado niste traballo ten como finalidade o transporte de grandes cantidades de crudo. Trátase dun buque VLCC capaz de transportar, segundo os requisitos previos de anteproxecto, 285000 tonelas de carga. Nistos cuadernos realizarase una rimeira aproximación ao detalle do diseño, construcción, equipamento e viabilidade económica dun proxecto distas características.

### **ENGLISH**

The projected vessel in this assignment has the mission of transporting very large volumes of crude. It consist in a Very Large Crude Carrier able to handle, according to Previous Anteproject Requisits, with 285000 deadweight tonnes. In this booklets a first close iteration for the ship´s design, construction, equipment and economic viability is done.

**GRADO EN INGENIERÍA NAVAL Y OCEÁNICA**  
**TRABAJO FIN DE GRADO**

**CURSO 2021-2022**

**PROYECTO NÚMERO**

**TIPO DE BUQUE:** VLCC de 285000 DWG

**CLASIFICACIÓN, COTA Y REGLAMENTOS DE APLICACIÓN:** DNV GL, SOLAS Y MARPOL

**CARACTERÍSTICAS DE LA CARGA:** CRUDO

**VELOCIDAD Y AUTONOMÍA:** 14,5 knots

**SISTEMAS Y EQUIPOS DE CARGA / DESCARGA:** Bombas para carga y descarga de tanques

**PROPULSIÓN:** Motor Diesel acoplado a una hélice de paso fijo

**TRIPULACIÓN Y PASAJE:** 35 tripulantes

**OTROS EQUIPOS E INSTALACIONES:** Los habituales para este tipo de buques.

Ferrol, 1 Diciembre 2021

**ALUMNO/A: Dª Esteban Martínez de la Colina Vilariño**

## 1 INTRODUCCIÓN

En este cuaderno se lleva ancho el compartimentado, la disposición y la capacidad de los tanques del buque del proyecto. Además, se estudiarán las curvas hidrostáticas distintos calados fijados y sus respectivas curvas de Kn.

A continuación, se muestran los parámetros más representativos del buque final y a partir de los cuales se parte para la realización de este cuaderno.

Características Principales del Buque			
Peso Muerto	TPM	285.000	ton
Eslora entre perpendiculares	Lpp	319,12	m
Manga	B	60	m
Calado	T	22,37	m
Puntal	D	29,6	m
Desplazamiento	Δ	369.520	ton
Coeficiente de Bloque	Cb	0,826	
Coeficiente Prismático	Cp	0,829	
Coeficiente de la Maestra (Kerlem)	Cm	0,996	
Velocidad de Servicio	Vs	14,5	knots
Potencia	Pot	42.390	kW
Revoluciones Hélice	RPM	72	rev/m

## 2 DEFINICIÓN DE CUADERNAS, BULÁRCAMAS Y DE LA ESTRUCTURA LONGITUDINAL

A continuación, se estudia la disposición de la estructura longitudinal del buque de proyecto. Para ello se utilizan los apuntes de la asignatura “Proyectos del Buque y Artefactos Marinos 1” de Basilio Puente Varela, y la Sociedad de Clasificación establecida en la RPS del buque.

### 2.1 Separación de cuadernas

Siguiendo el criterio establecido por los buques de referencia de la base de datos, se decide que la separación entre cuadernas seguirá la siguiente distribución:

- Desde el espejo de popa hasta mamparo de popa de cámara de máquinas: 0,8m
- Zona de Cámara de Máquinas: 0,7m
- Desde mamparo de proa de cámara de máquinas hasta mamparo de colisión: 1m
- Desde mamparo de colisión hasta la roda: 0,8m

### 2.2 Separación de bulárcamas

Las bulárcamas conforman los anillos estructurales del buque, y dichos anillos estarán dispuestos cada 4 cuadernas. Es decir:

$$S_{bulárcamas} = 5 \text{ claras d ecuadernas}$$

Esta distancia se mantiene a lo largo de toda la eslora del buque.

### 2.3 Tabla de posiciones de cuadernas, bulárcamas y mamparos principales

Cuaderna	Pos. Long.	TIPO
-8	-6,40	Bulárcama
-7	-5,60

### 3 COMPARTIMENTADO TRANSVERSAL

#### 3.1 Posiciones de mamparos transversales principales

Length (m)	Number of bulkheads for ships with aft machinery (1)	Number of bulkheads for other ships
$L < 65$	3	4
$65 \leq L < 85$	4	5
$85 \leq L < 105$	4	5
$105 \leq L < 120$	5	6
$120 \leq L < 145$	6	7
$145 \leq L < 165$	7	8
$165 \leq L < 190$	8	9
$L \geq 190$	to be defined on a case by case basis	

(1) After peak bulkhead and aft machinery bulkhead are the same.

#### 3.2 Posición del mamparo de colisión

**Eslora de Francobordo y Perpendiculares**

Puntal [D]	29,6	m
85% D	25,16	m
Lwl (85%D = 25,16 m)	319	m
Posicion extremo de popa	-6,4	m
Eslora entre perpendiculares al 85%D	312,6	m
<b>Eslora de francobordo</b>	<b>312,600</b>	<b>m</b>
<b>Posicion perpendicular de proa</b>	<b>312,600</b>	<b>m</b>
<b>Posicion maestra (L/2)</b>	<b>156,300</b>	<b>m</b>
<b>Posición perpendicular de popa</b>	<b>0,000</b>	<b>m</b>

**Posición del Mamparo de Colisión**

Extensión del bulbo a proa de la perp. de proa	0,000	m
<i>Mitad de la extension</i>	0,000	m
<i>0.015L</i>	4,689	m
<i>3 m</i>	3,000	m
Pos. Referencia a proa	= 312,6 + 0	312,600 m
<b>Posición máxima hacia popa</b>	<b>= 312,6 - 25,008</b>	<b>287,592 m</b>
<i>0.08L</i>	25,008	m
<i>0.05L + 3 m</i>	18,630	m
<b>Posición máxima hacia proa</b>	<b>= 312,6 - 10</b>	<b>302,600 m</b>
<i>0.05L</i>	15,630	m
<i>10 m</i>	10,000	m

**El mamparo de colisión estará situado entre X = 287,592 m y X = 302,6 m**

Posicion Actual	Cuaderna 312	293,6	m
-----------------	--------------	-------	---

## 4 COMPARTIMENTADO VERTICAL

### 4.1 Altura de doble fondo

El cálculo de la altura del doble fondo se recoge en el Convenio Marpol Nexo1Chap. 3 rule 12A. La altura del doble fondo a instalar en el buque será el menor de los siguientes resultados:

$$h_{df} = \frac{B}{15} = \frac{60}{15} = 4 \text{ m ó } 2\text{m}$$

Ambos valores son algo extremos por lo que se decide diseñar un doble fondo situado a una altura de:

$$h_{df} = 3 \text{ m}$$

### 4.2 Posiciones de Cubiertas

Nombre	Posición S.L.B. (m)
Doble fondo	3,00
Entrepuente de máquinas	11,5
Cubierta principal	30
1 Superestructura	33

## 5 COMPARTIMENTADO LONGITUDINAL

### 5.1 Doble casco

De la misma manera que el doble fondo, las distancias mínimas del doble casco se definen en el Marpol Anexo 1 Cap. 3 Regla 12. La siguiente fórmula define el ancho mínimo de doble casco:

$$w_{doble\ casco} = 0,5 + \frac{DWT}{20000} = 14,75\ m$$

Como es un valor demasiado excesivo, se va al valor mínimo estipulado que es de 2 m de espesor de doble casco.

En el caso del buque de proyecto se decide que ancho del doble fondo será de 2,5 m.

### 5.2 Otros mamparos longitudinales interiores

Se instalan dos mamparos longitudinales que dividen en tres los espacios de carga por cada sección transversal del buque en la zona de carga. Dichos mamparos discurren desde el mamparo transversal de popa de la zona de carga hasta el mamparo de colisión en proa. Es decir, desde la cuaderna N°77 hasta la 312. La separación de dichos mamparos es de 11 metros a estribor y babor de la línea de crujía dejando una manga total de los tanques de crudo centrales de 22m.

Los tanques de carga laterales, a estribor y babor de los tanques centrales, se prolongan desde los 11 m medidos perpendicularmente a la línea de crujía, hasta los 27,5 m. De esta forma la manga de estos tanques será de 16,5m, salvo en las zonas en las que el buque afina sus formas y por lo tanto disminuye su manga (tanques N°1 y N°5 de proa y popa).

## 6 JUSTIFICACIÓN DE LOS ESPACIOS DE CARGA

La zona de carga se destina a albergar el crudo que trasportará el buque de proyecto.

En las RPA se impone que el tonelaje de peso muerto del buque tiene que ser de 285000 TPM. Por lo tanto, este parámetro será crítico a la hora a la hora de llevar a cabo el diseño del compartimentado del buque.

El Convenio del Marpol, y las Sociedades de Clasificación, se encargan de regular los parámetros y dimensiones de estas zonas de carga.

La zona de carga se sitúa desde el mamparo de colisión de la cámara de máquinas hasta el mamparo de colisión. Además, el buque debe tener estructura con doble casco y doble fondo a lo largo de la totalidad de la eslora de esta zona.

### 6.1 DOBLE FONDO

El cálculo de la altura del doble fondo se recoge en el Convenio Marpol Nexo1Chap. 3 rule 12A. La altura del doble fondo a instalar en el buque será el menor de los siguientes resultados:

$$h_{df} = \frac{B}{15} = \frac{60}{15} = 4 \text{ m ó } 2\text{m}$$

Ambos valores son algo extremos por lo que se decide diseñar un doble fondo situado a una altura de:

$$h_{df} = 3 \text{ m}$$

### 6.2 DOBLE CASCO

El cálculo del espesor de doble casco se recoge en el Convenio Marpol Nexo1Chap. 3 rule 12A. El espesor del doble casco a instalar en el buque será el menor de los siguientes resultados:

$$w_{df} = 0,5 + \frac{DWT}{20000} = 0,5 + \frac{285000}{20000} = 14,75 \text{ m ó } 2\text{m}$$

Se decide emplear el mismo espesor de doble casco que de doble fondo por unificar criterios y facilitar diseño y construcción, por lo que:

$$w_{df} = 2,5 \text{ m}$$

Los espacios libres entre las zonas de carga y el costado del buque y entre las zonas descarga y el fondo del buque se aprovecharán para conformar tanques de lastre. Además, según el Convenio Marpol:

Todos aquellos petroleros con un peso muerto superior a 20000TPM deben ir provistos de lastre separado con una capacidad tal que para todas las condiciones de carga se cumplan los siguientes requisitos:

- Se permita al buque navegar en condiciones de lastre sin necesidad de lastrar los tanques de carga.
- El lastre adicional del punto descrito en el apartado anterior solo se podrá emplear si los tanques de carga están debidamente lavados según la Regla 35 del Marpol.
- El calado de trazado de la cuaderna maestra nunca será inferior a:  
$$T_m = 2 + (0,02L)$$
- Los calados en las perpendiculares de proa y popa se corresponderán con los determinados por el calado en el centro del buque ( $T_m$ ), con un asiento a popa inferior a:

$$T_{ppop} = 0,0155L$$

- El calado en popa debe garantizar la total inmersión de la hélice.

## 6.3 COFFERDAM

A proa de la cámara de máquinas se sitúa un cofferdam que separa la zona de carga de la cámara de máquinas.

Según las Sociedades de Clasificación, el cofferdam es obligatorio para buques de carga líquida como el de proyecto, y además el espaciado mínimo es de 600mm.

## 6.4 TANQUES DE CARGA

El Convenio Marpol establece que la eslora máxima de los tanques de carga debe ser:

$$L_{MAX\ tanques} = (0,25 \times \frac{b_i}{B} + 0,15) \times L$$

Siendo:

- $b_i$  la distancia entre el costado del buque y el mamparo longitudinal exterior del tanque de carga, medido de forma perpendicular a crujía. En el caso del buque de proyecto está distancia son los 2,5 m del doble casco.

Por lo que:

$$L_{MAX\ tanques} = 51,17\ m$$

La zona de cántara se ubica a popa de los tanques Slops. Además, de acuerdo con las pautas recomendadas para el tamaño y TPM del buque de proyecto, se disponen dos mamparos longitudinales que dividen la zona de carga en tres tanques por cada sección transversal. De esta forma se consigue una reducción en el efecto de superficies libres sobre la estabilidad y se puede incrementar, según el siguiente criterio, la eslora máxima de tanques de carga:

$$L_{MAX\ tanques} = 0,2L_{pp} = 63,8\ m$$

La distancia disponible, en eslora, para la disposición de los tanques de carga es de:

$$L_{Disp.\ Tanques\ Carga} = 245\ m$$

Si esta eslora se divide en 5 compartimentos, lo cual da un total de 15 tanques de carga si se tiene en cuenta los dos mamparos longitudinales que irán instalados, sale una eslora década tanque de:

$$L_{Unitaria\ Tanques\ Carga} = 49\ m$$

Pero los mamparos transversales que van a servir como divisiones de tanques deben coincidir siempre sobre una bulárcama o anillo estructural del buque. Por lo tanto, la disposición de los tanques queda de la siguiente manera:

DISPOSICIÓN TANQUES DE CARGA						
TANQUES		LONGITUD (m)	BULÁRCAMAS			
			Número		Posición respecto a Lpp (m)	
5	Estribor	40	Inicio	Fin	Inicio	Fin
	Central		77	117	58,6	98,6
	Babor					
4	Estribor	50	117	167	98,6	148,6
	Central					
	Babor					
3	Estribor	50	167	217	148,6	198,6
	Central					
	Babor					
2	Estribor	50	217	267	198,6	248,6
	Central					
	Babor					
1	Estribor	45	267	312	248,6	293,6
	Central					
	Babor					

## 6.5 TANQUES SLOPS

Los tanques Slops o de dcantación se sitúa a proa del Coffedam y a popa de los tanques de carga. Según el Convenio Marpol, Anexo 1 Capítulo 4 rule 29, el volumen de carga de estos no puede ser inferior al 3% del volumen de los tanques de carga. A no ser que:

- Existan tanques de lastre separado, entonces el volumen de estos tanques podrá ser del 2%.
- Se haya instalado un sistema de limpeza de tanques de carga mediante lavado con crudos, entonces estos tanques podrán ser del 2%.

Como se cumple con los dos requisitos anteriores el volumen mínimo de estos tanques podrá ser del 2% del volumen total de la carga.

Los petroleros de crudo con u peso muerto superior a 70000 TPM deberán llevar al menos dos tanques Slop.

Estos tanques deben tener la capacidad suficiente para almacenar los vertidos generados en el lavado de tanques, residuos de aceites y residuos sucios de lastre.

A continuación, se hace una estimación del Volumen de la carga para posteriormente poder dimensionar los tanques Slop.

$$V_{carga} = \frac{TPM - Consumos - Víveres - Pesos Fijos}{\rho}$$

Siendo:

- TPM-Consumos-Víveres-Pesos Fijos= Carga útil
- Carga útil se sabe del cuaderno 1 que son 280144 ton
- La densidad del crudo 0,86 ton/m3.

Por lo que se puede calcular que el volumen de la carga debe ser:

$$V_{carga} = 325748 \text{ m}^3$$

Y el volumen mínimo de los tanques de decantación o tanques Slop será de:

$$V_{\min slop} = 0,02 \times V_{carga} = 6514 \text{ m}^3$$

Como son dos tanques, el volumen de cada tanque será la mitad del obtenido, es decir:

$$V_{tanque slop} = 3257,48 \text{ m}^3$$

## 7 DIMENSIONADO DE TANQUES

### 7.1 Sistema de combustible

#### 7.1.1 Necesidades de combustible y volumen total del mismo

A la hora de disponer estos tanques hay que tener en cuenta el Convenio Marpol. Este especifica que para buques con tanques de más de 600m<sup>3</sup>, como es el caso, los tanques han de ubicarse separados del forro exterior.

Autonomia	8400	millas
Velocidad	14,5	nudos
Dias navegacion	24,1	dias
Horas navegacion	579	horas

Tipo combustible	Fuel Oil	
Densidad	0,92	t/m <sup>3</sup>

Consumidor	Num	Potencia Unit.	Consumo Esp.	Consumo
		kW	g/kWh	ton/h
Motores Principales	1	26000	170	4,41
Eje generador	0	0	0	0,00
Generadores auxiliares	2	1940	130	0,50
Generador de emergencia	1	1940	130	0,25
			Total (ton/h)	5,16
Consumo total en navegación	2991,3	ton		
Volumen neto necesario para consumo	3251,4	m <sup>3</sup>		

Llenado a la salida de puerto	98%
Llenado a la llegada a puerto	10%

Volumen neto necesario de tanques	3694,8	m <sup>3</sup>
-----------------------------------	--------	----------------

Este volumen se dispondrá en 4 tanques de almacén.

#### 7.1.2 Tanques de uso diario

$$V_{uso\ dia} = \frac{Cep \times Pot \times 24h}{10^6 \times \rho} = 108,52\ m^3$$

Es un volumen demasiado grande por lo que se divide en dos más pequeños.

#### 7.1.3 Tanques de sedimentación

El propósito de este tanque es el de separar por sedimentación las partículas de FO más pesadas, dando como resultado una purificación del combustible.

$$V_{sedimentación} = \frac{Cep \times Pot \times 36h}{10^6 \times \rho} = 162,78\ m^3$$

### 7.1.4 Tanques almacén

Se obtiene mediante la resta del total necesario menos uso diario y sedimentación

$$V_{almacen} = V_{NETO} - V_{uso\ diario} - V_{sedimentación}$$
$$V_{almacen} = 3424\ m^3$$

## 7.2 Sistema de agua dulce y técnica

### 7.2.1 Necesidades de agua dulce

De acuerdo con la norma ISO 15749 para buques de transporte de mercancía, se establece que el consumo de agua por día es de 150 l/persona. Entonces:

$$V_{agua\ dulce} = \frac{150 \times 35tripul.\times 8400\ millas}{14,5\ knots \times 24h \times 1000L} = 126\ m^3$$

Se dispondrá de dos tanques de agua dulce, de tal manera que se cumpla ampliamente la demanda requerida.

### 7.2.2 Necesidades de agua técnica

El agua técnica se utiliza para las máquinas y el circuito de vapor.

En los buques de referencia se observa que todos cuentan con dos tanques de agua técnica de unos 200m<sup>3</sup> cada uno de ellos.

$$V_{agua\ técnica} = 200\ m^3\ (cada\ tanque)$$

## 7.3 Sistema de aceite de lubricación

### 7.3.1 Necesidades de aceite

Se estima que el peso de aceite utilizado en la lubricación de motores es un 4% del peso del combustible empleado para la propulsión (FO). Por lo tanto

$$W_{aceite\ lubric} = 0,04 \times 2991, ton = 119,652\ ton$$

$$V_{aceite\ lubric.} = \frac{W_{aceite}}{\rho_{aceite}} = 130,05\ m^3$$

Este volumen es el necesario para el motor principal pero se instalará otro idéntico , de reserva, para cubrir necesidades del resto de máquinas.

## 7.4 Tanques misceláneos

### 7.4.1 Aguas Grises y Negras

Para los cálculos de capacidad de estos tanques se emplea la Norma UNE EN ISO 15749.

Tipo de buque	Cantidad mínima de agua de desecho por persona y día en litros			
	Planta sin vacío		Planta con vacío	
	Aguas negras	Aguas negras y grises	Aguas negras	Aguas negras y grises
Buques de pasaje	70	230	25	185
Buques de alta mar exceptuando los de pasaje	70	180	25	135

Los buques costeros pueden conservar los valores recomendados por las autoridades responsables.  
NOTA - Estos valores son los recomendados. Hay que considerar las posibles variaciones debidas a los reglamentos nacionales o a las recomendaciones de las sociedades de clasificación.

$$180 \times 35 \text{ tripulantes} = 6300 \frac{l}{día} = 6,3 \text{ m}^3/\text{día}$$

Por lo tanto:

$$V_{aguas\ resid.} = 6,3 \frac{8400}{14,5 \times 24} = 152 \text{ m}^3$$

#### 7.4.2 Lodos

Según el Marpol, este tanque es obligatorio para buques de mas de 400GT. El volumen de este tanque es de un 1,5% del combustible necesario para la propulsión. El tanque se instala en el doble fondo de la cámara de máquinas.

$$V_{lodos} = 55,41 \text{ m}^3$$

#### 7.4.3 Derrames

Siguiendo los criterios de los buques base incluidos en la base de datos del proyecto, este tanque deberá disponer de unas dimensiones cercanas a los 40m<sup>3</sup>.

$$V_{derrames} = 40 \text{ m}^3$$

### 7.5 Sistema de lastre

Los tanques de lastre se llenan con agua de mar, de esta forma, se facilita la navegación del buque cuando éste no satisface las condiciones de estabilidad y trimado debido a que el buque navega en lastre (sin carga) o que haya agotado los consumos.

Estos tanques se disponen a lo largo de la zona de carga, envolviéndola por dentro del doble fondo y del doble casco.

EL buque debe disponer de suficiente lastre como para garantizar que la hélice quede totalmente sumergida cuando este navega sin carga. Este calado debe ser como mínimo, algo superior al siguiente:

$$T_{min} = D \text{ hélice} \times 1,1 = 10,5 \times 1,1 = 11,55 \text{ m}$$

Con este dato se puede calcular el desplazamiento mínimo:

$$\Delta_{min} = C_b \times \rho \times Lpp \times B \times T_{min}$$

$$\Delta_{min} = 192792,53 \text{ ton}$$

Por lo tanto, el peso del agua de lastre que se debe embarcar para satisfacer esta condición será:

$$W_{lastre} = \Delta_{min} - P.Rosca$$

- El peso en rosca se calculó en cuaderno 2 y es de un total de 49428 ton.

Entonces:

$$W_{lastre} = 143364 \text{ ton}$$

Y el volumen de agua de mar equivalente a ese peso será:

$$V_{lastre} = \frac{W_{lastre}}{\rho \text{ agua mar}} = 139731 \text{ m}^3$$

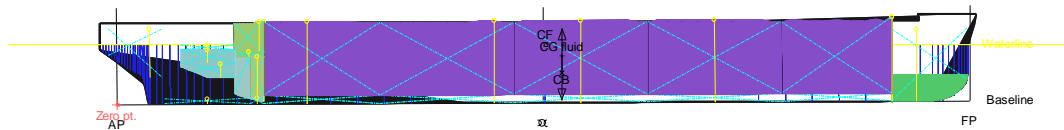

## 7.6 COMPARATIVA DE VOLÚMENES CALCULADOS CON LOS DISPONIBLES EN EL BUQUE

	VOLUMEN TANQUE CALCULADO (m <sup>3</sup> )	VOLUMEN TANQUE MAXSURF (m <sup>3</sup> )
Tanques Slop	3257,48	6316,67
Total Tanques de Carga	325784	326419,77
2 Tanques de Uso Diario	108,52	330
Tanque de Sedimentación	162,78	330
4 Tanques de Almacén	3424	3528,354
Tanque de Agua Dulce	252	1611,37
Tanque de Agua Técnica	400	725
Tanque de Aceite Lubricante	260	290
Tanque de Aguas Residuales	152	782
Tanque de Lodos	55,41	273,87
Tanque de Derrames	40	362,6
Tanques de Lastre	139731	121655,99

## 8 ZONA ESTANCA Y PUNTOS DE INUNDACIÓN

### 8.1 Definición de la zona estanca

La zona estanca se situará por debajo de la cubierta principal debido a quelas tapas de las escotillas, ventilaciones de los tanques, y bodegas son estancas.

### 8.2 Puntos de inundación

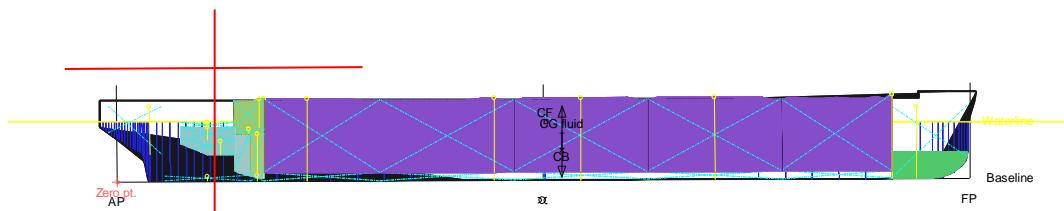

Existen dos puntos de inundación correspondientes con la ventilación de la cámara de máquinas. Se sitúan en las siguientes coordenadas

- Ventilación de Esterior de C.Maq.

Dist a Perpend Popa (m)	Dist a LB (m)	Offset a crujía (m)
37,00	36,00	20,00

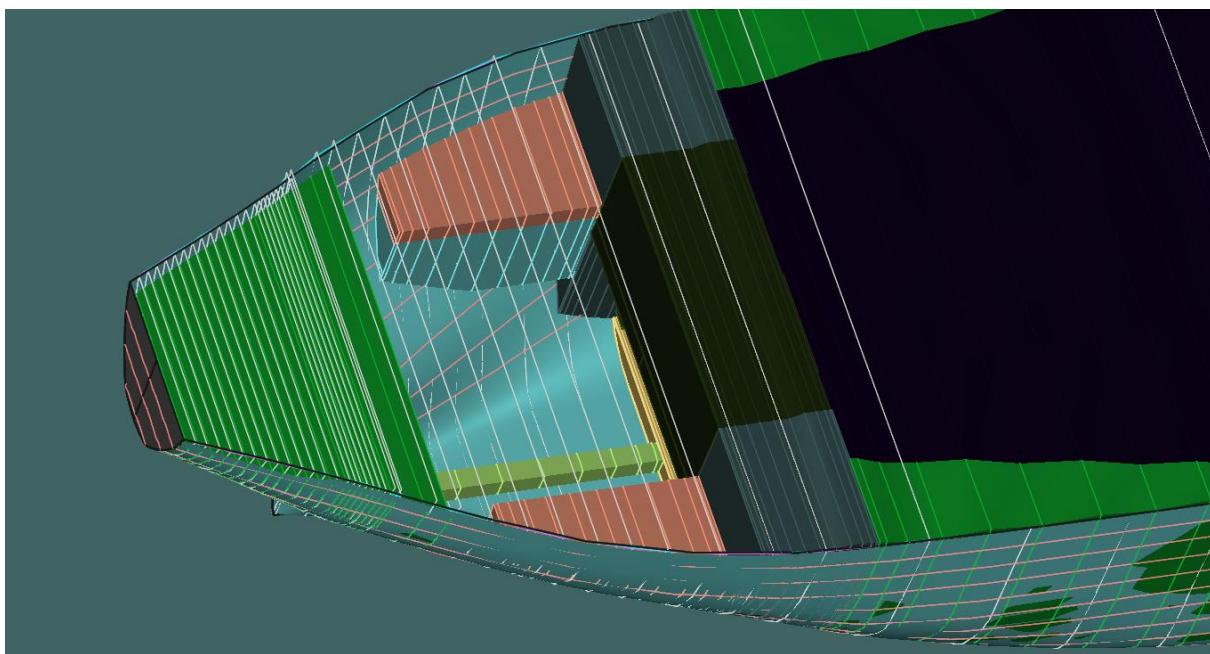

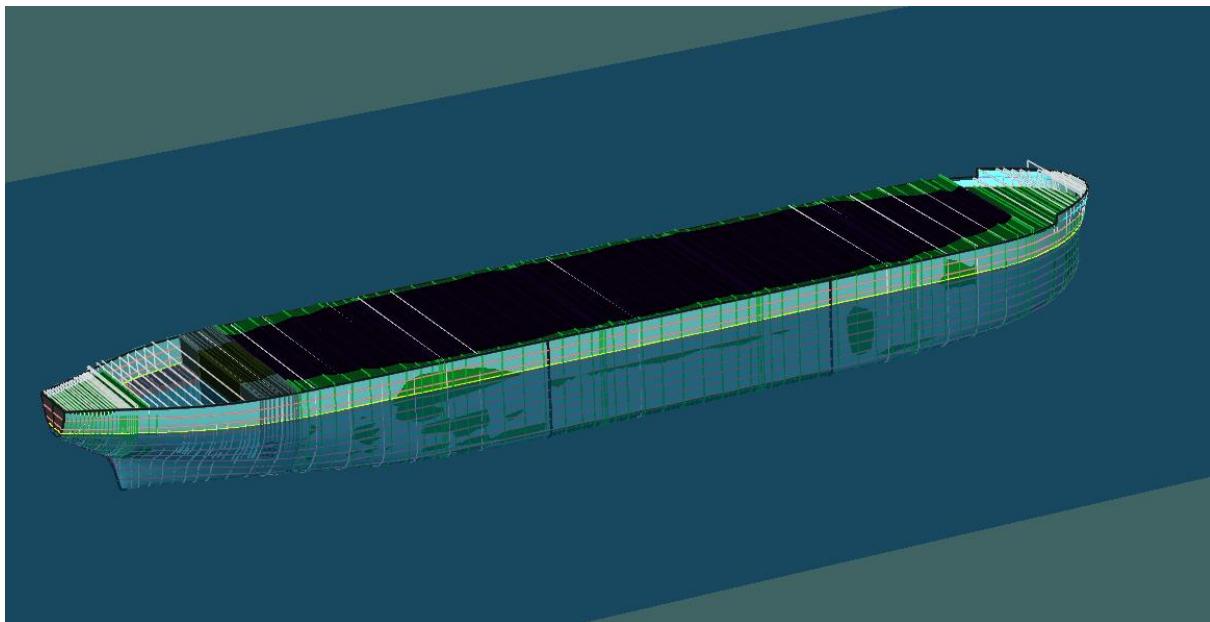

- Ventilación de Babor de C.Maq.

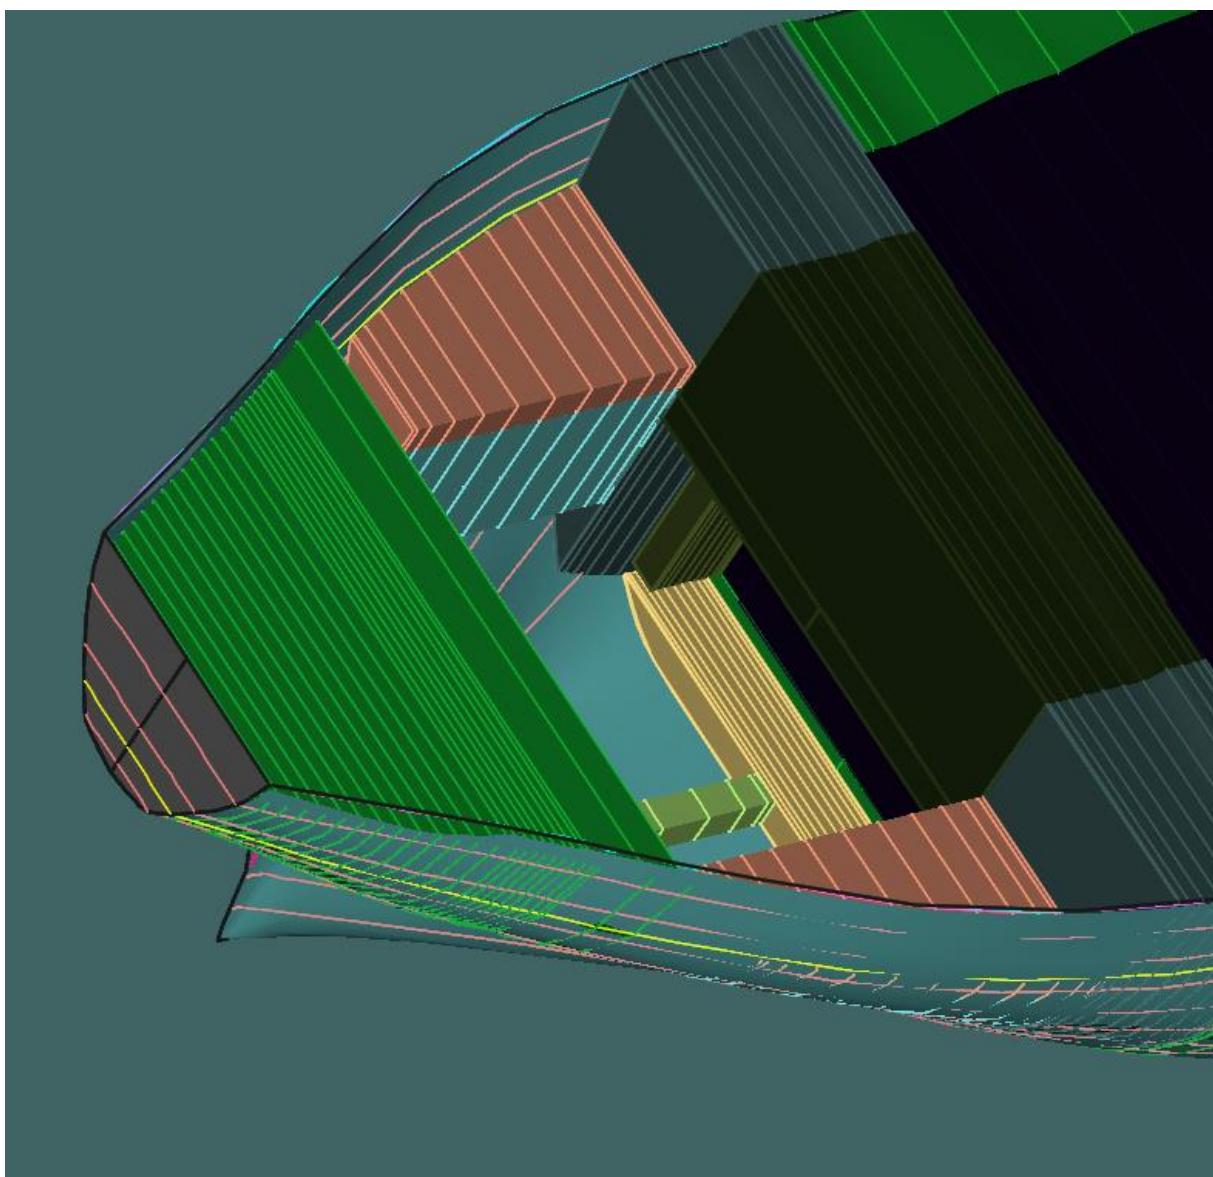

Dist a Perpend Popa (m)	Dist a LB (m)	Offset a crujía (m)
37,00	36,00	-20,00
