

**FIGURE 5.** Survival probability in various biopsy groups by modified rejection sign-out categories, histology diagnoses, or injury archetypes. Kaplan-Meier plots showing 3-y postbiopsy survival stratified by (A) injury archetype groups and (B) injury archetype groups after removing all samples with molecular rejection (TCMR and AMR). (C) Survival probability in only TCMR biopsies and (D) in only AMR biopsies by modified rejection sign-out categories, comparing Late- and Severe-injury biopsies to those assigned to No-, Mild-, and Moderate-injury groups. All biopsy counts (N) per panel represent the selected population. AMR, antibody-mediated rejection; TCMR, T cell-mediated rejection.
